

LRSIM — Liability Resolution Initiation Module

LRSIM — Liability Resolution Initiation Module

Architecture: LIGA™ — Liability Governance Architecture
Parent Standard: Liability Resolution & Discharge Standard (LRDS)
Category: Governance & Enforcement
Subcategory: Liability Governance
Type: Core Module
Governed Space: Liability Resolution Initiation
Module ID: LIGA-LRDS-LRSIM-001
Origin ID: OOF.CM.LIGA.11.01.01
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 25 September 2026
Compatibility: OOF® Methodology OS™ · Modular OOF® Architecture Ecosystem
AI-Readable: Yes
Authority: OOF® — OriginOpen® Foundation
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL™)

Canonical Definition

The Liability Resolution Initiation Module (LRSIM) governs how an established active Liability requirement enters Resolution & Discharge governance.

It identifies whether a Resolution-relevant event, process, condition, proposal, performance, payment, agreement, authoritative action, or other mechanism creates a legitimate basis to initiate Resolution governance; identifies the exact Liability requirement or Relationship to which the initiation relates; establishes the Resolution Object, participating Subjects, preliminary Resolution Basis, Scope, Boundary, dependencies, and applicable authority; and preserves the active Liability state until subsequent governance establishes Satisfaction, Settlement, Discharge, or another legitimate Resolution state.

LRSIM prevents a Resolution-relevant event from being represented prematurely as Liability Resolution.

Its foundational distinction is:

Resolution-Relevant Event ≠ Liability Resolution.

Operational Role

The operational role of LRSIM is:

to establish whether an active Liability requirement has legitimately entered Resolution governance and to define exactly what is entering that process without prematurely treating the Liability as resolved.

LRSIM establishes the governed starting point for LRDS.

Position in the LRDS Internal Flow

The internal LRDS progression is:

Liability Resolution Initiation → Liability Satisfaction → Liability Settlement → Liability Discharge → Liability

Resolution Verification

LRSIM governs:

Liability Resolution Initiation

Its principal input is an:

Active Liability Structure

including relevant Transfer, Sharing, Recourse, or secondary Liability structures where applicable.

Its principal output is:

Governed Liability Resolution Initiation Structure

The output proceeds to subsequent LRDS governance according to the applicable Resolution pathway.

Central Operational Question

Has an active Liability requirement legitimately entered Resolution governance, what exactly is proposed or expected to be resolved, for which Subjects and Relationships, under what preliminary Basis, Scope, Boundary, conditions, and authority?

Resolution Initiation

Resolution Initiation is the governed transition from active Liability into a process capable of producing Resolution or Discharge.

Initiation does not mean that the process has succeeded.

Therefore:

Resolution Initiation $\neq$ Liability Resolution.

Active Liability Prerequisite

LRSIM requires an identifiable Liability structure to which the proposed Resolution relates.

The structure should preserve, where relevant:

Liability Origin, Liability Relationship, Liability Subject, Scope, Allocation, State, Transfer, Sharing, Recourse, and other active requirements.

Resolution-Relevant Event

A Resolution-Relevant Event is an event or condition that creates a legitimate reason to examine whether active Liability may proceed toward Resolution.

Examples may include:

payment, performance, offer of performance, Settlement proposal, Settlement agreement, release proposal, Discharge mechanism, authoritative decision, Extinguishment mechanism, waiver where applicable, or another legitimate Resolution-related event.

Event vs Resolution

The existence of a Resolution-Relevant Event is insufficient to establish Resolution.

Therefore:

Resolution-Relevant Event $\neq$ Liability Resolution.

Resolution Trigger

A Resolution Trigger is the specific event, condition, or governed change that causes Resolution governance to begin.

The trigger should remain explicit.

Trigger vs Completion

A Resolution Trigger initiates governance.

It does not determine its outcome.

Therefore:

Resolution Trigger $\neq$ Resolution Completion.

Resolution Initiation Basis

Every initiated Resolution process should possess an identifiable preliminary Basis explaining why Resolution governance has become relevant.

Liability Basis vs Resolution Initiation Basis

The original Liability Basis and the Resolution Initiation Basis may differ.

Therefore:

Liability Basis $\neq$ Resolution Initiation Basis by default.

Resolution Object Identification

LRSIM should identify exactly what Liability requirement is entering Resolution governance.

The Resolution Object may be:

a complete Liability Relationship, part of a Liability Relationship, a monetary requirement, a performance requirement, a shared Liability component, a transferred requirement, a Recourse Relationship, or another bounded Liability requirement.

Resolution Object vs Liability Object

The object being resolved is not necessarily identical to the original Liability Object.

Therefore:

Resolution Object $\neq$ Liability Object by default.

Resolution Object Identity

The Resolution Object should possess sufficient identity to remain distinguishable from other active Liability requirements.

Complete Resolution Object

Where the complete Liability Relationship is proposed for Resolution, that Scope should be explicit.

It should not be inferred from a generic closure action.

Partial Resolution Object

Resolution may concern only part of the active Liability.

Therefore:

Partial Resolution Object $\neq$ Complete Liability Relationship.

Multi-Object Resolution

One Resolution process may concern multiple Liability requirements.

Each requirement should remain independently identifiable.

Therefore:

One Resolution Process $\neq$ One Resolution Object by default.

Resolution Subject Identification

LRSIM should identify Subjects participating in or affected by Resolution Initiation.

These may include:

Liability-bearing Subjects, performing Subjects, paying Subjects, receiving Subjects, Settlement participants, Recourse Subjects, authorized representatives, or other relevant parties.

Subject Role Distinction

A Subject's role in Resolution may differ from its role in the underlying Liability.

Therefore:

Liability-Bearing Subject $\neq$ Resolution-Performing Subject by default.

Paying Subject

A paying Subject may participate in Resolution without being the primary Liability-bearing Subject.

Therefore:

Paying Subject $\neq$ Liability-Bearing Subject by default.

Performing Subject

A Subject performing a requirement may differ from the Subject whose Liability is being resolved.

Therefore:

Performing Subject $\neq$ Liability-Bearing Subject by default.

Resolution Beneficiary

Where relevant, the Subject receiving performance, payment, release, or another Resolution-related benefit should remain identifiable.

Multi-Subject Initiation

A Resolution process may affect several Subjects differently.

Subject-specific effects should remain explicit.

Therefore:

Multi-Subject Resolution Initiation $\neq$ Uniform Subject Resolution.

Resolution Relationship Identification

LRSIM should identify the exact Liability Relationship or Relationships affected by Resolution Initiation.

Relationship-Specific Initiation

Initiation concerning one Liability Relationship should not automatically initiate Resolution of another.

Therefore:

Resolution Initiation for Relationship A $\neq$ Resolution Initiation for Relationship B.

Primary Liability Initiation

A primary Liability Relationship may enter Resolution independently of secondary Relationships.

Recourse Resolution Initiation

A Recourse Relationship may enter its own Resolution process.

Therefore:

Primary Liability Resolution Initiation $\neq$ Recourse Resolution Initiation.

Network Resolution Initiation

A wider Liability Network may contain multiple independently initiated Resolution processes.

A local initiation should not be treated as network-wide initiation.

Therefore:

Local Resolution Initiation $\neq$ Liability Network Resolution Initiation.

Resolution Scope

LRSIM should establish the preliminary Scope of the proposed Resolution.

The Scope may be:

complete, partial, Subject-specific, Relationship-specific, obligation-specific, Recourse-specific, conditional, or otherwise bounded.

Scope Sufficiency

The proposed Resolution Scope should be sufficiently explicit to determine what subsequent Resolution governance must evaluate.

Resolution Scope vs Liability Scope

Resolution Scope may concern only part of established Liability Scope.

Therefore:

Resolution Scope $\neq$ Liability Scope by default.

Resolution Boundary

LRSIM should establish a boundary distinguishing:

what enters Resolution governance, what remains active outside it, which Subjects are affected, which Relationships are affected, and which requirements remain unchanged.

Boundary Integrity

A Resolution process should not silently expand beyond its established Boundary.

Therefore:

Resolution Initiation $\neq$ Authority to Resolve Unbounded Liability.

Remaining Active Liability

Any Liability outside the Resolution Boundary should remain active unless independently changed through legitimate governance.

Therefore:

Resolution Initiation $\neq$ Suspension of All Liability by default.

Resolution Pathway

LRSIM should identify the anticipated Resolution pathway where known.

Possible pathways may include:

Satisfaction, performance, Settlement, Discharge, Extinguishment, release, waiver, or another legitimate mechanism.

Pathway vs Outcome

Identification of a Resolution pathway does not establish that the pathway will succeed.

Therefore:

Resolution Pathway $\neq$ Resolution Outcome.

Satisfaction Pathway

Where Resolution is expected through fulfillment of an active requirement, LRSIM should route the matter toward Satisfaction governance.

Settlement Pathway

Where Resolution is expected through negotiated or otherwise governed Settlement, the Settlement pathway should remain explicit.

Discharge Pathway

Where a Liability requirement may cease through Discharge or Extinguishment rather than direct Satisfaction, the relevant pathway should remain explicit.

Multiple Resolution Pathways

A Liability requirement may involve more than one Resolution pathway.

Example:

payment plus corrective performance, Settlement plus later Satisfaction, or partial Satisfaction followed by Discharge.

Therefore:

One Liability Requirement $\neq$ One Resolution Pathway by default.

Resolution Conditions

Initiation may depend upon conditions.

These may concern:

payment, performance, authority, agreement, verification, timing, documentation, another Relationship, or another governed requirement.

Condition State

A Resolution Initiation condition may be:

Satisfied, Unsatisfied, Partially Satisfied, Pending, Unknown, Uncertain, or Disputed.

Conditional Initiation

A Resolution process may be initiated conditionally.

Therefore:

Conditional Resolution Initiation $\neq$ Conditional Resolution Completion.

Resolution Dependency

A Resolution process may depend upon another event, Subject, Relationship, authority, or governance state.

Dependencies should remain explicit.

Dependency vs Resolution

Existence of a dependency does not establish that the dependency has been satisfied.

Therefore:

Resolution Dependency $\neq$ Resolution Condition Satisfaction.

Resolution Authority

Where Resolution Initiation requires authority, LRSIM should identify:

the authority, its source, its Scope, affected Subjects, affected Relationships, and relevant limitations.

Authority Sufficiency

A Subject authorized to initiate one Resolution pathway may not possess authority to complete another.

Therefore:

Resolution Initiation Authority $\neq$ Resolution Completion Authority by default.

Local Authority

Authority concerning one Liability Relationship should not be projected onto an entire Liability Network.

Therefore:

Local Resolution Authority $\neq$ Universal Liability Resolution Authority.

Authority Conflict

Where competing authorities claim incompatible Resolution roles, the conflict should remain explicit.

Payment as Initiation Event

Payment may trigger Resolution governance.

It should not automatically establish Satisfaction or Resolution.

Therefore:

Payment $\neq$ Liability Resolution by default.

Partial Payment

Partial payment may initiate partial Satisfaction governance while other requirements remain active.

Therefore:

Partial Payment $\neq$ Complete Resolution.

Third-Party Payment

Payment by a third party may create Resolution relevance without changing primary Liability identity.

Therefore:

Third-Party Payment $\neq$ Liability Transfer by default.

Performance as Initiation Event

Performance may trigger Satisfaction assessment.

Performance should be evaluated against the actual Liability requirement.

Therefore:

Performance $\neq$ Satisfaction by default.

Partial Performance

Partial performance may initiate Resolution governance for a bounded component.

It should not be represented as complete Satisfaction.

Settlement Proposal

A Settlement proposal may initiate a Resolution pathway.

A proposal is not a Settlement.

Therefore:

Settlement Proposal $\neq$ Settlement.

Settlement Agreement

A Settlement agreement may create Resolution relevance and future performance requirements.

Its existence does not necessarily establish completed Resolution.

Therefore:

Settlement Agreement $\neq$ Liability Resolution by default.

Settlement and Admission

Settlement Initiation should not be interpreted automatically as admission of Liability.

Therefore:

Settlement Initiation $\neq$ Admission of Liability.

Discharge-Relevant Event

An event may indicate that Discharge should be assessed.

The event itself does not establish Discharge.

Therefore:

Discharge-Relevant Event $\neq$ Liability Discharge.

Release-Relevant Event

A release proposal or act may create Resolution relevance.

Its actual effect must remain bounded to its governed Scope and authority.

Waiver-Relevant Event

A waiver may create Resolution relevance where applicable.

Waiver of one right or requirement should not automatically erase the underlying Liability structure.

Extinguishment-Relevant Event

An event capable of extinguishing an active Liability requirement may initiate Resolution governance.

The Extinguishment state remains subject to subsequent governance and verification.

Claim Event

Claim payment, closure, rejection, or withdrawal may create Resolution relevance.

It does not independently determine Liability Resolution.

Therefore:

Claim Closure $\neq$ Liability Resolution.

Harm Resolution Event

Harm Recovery or Harm Resolution may create relevant context.

It does not establish Liability Resolution.

Therefore:

Harm Resolution $\neq$ Liability Resolution.

Operational Termination Event

Termination of an operational mechanism or relationship may create relevant context.

It does not establish Liability Resolution.

Therefore:

Operational Termination $\neq$ Liability Resolution.

Contract Termination Event

Contract termination may affect Resolution conditions without automatically resolving existing Liability.

Therefore:

Contract Termination $\neq$ Liability Resolution.

Administrative Closure Event

A system may mark a matter as closed.

That signal may initiate verification but cannot establish Resolution by itself.

Therefore:

Administrative Closure $\neq$ Verified Liability Resolution.

Initiation State

LRSIM may represent initiation states such as:

Not Initiated, Proposed, Pending, Conditionally Initiated, Initiated, Partially Initiated, Unknown, Uncertain, Disputed, Rejected, Superseded, or another explicitly governed state.

These are methodological states, not universal legal classifications.

Proposed Initiation

A proposal to resolve Liability does not mean Resolution governance has fully commenced.

Therefore:

Resolution Proposal $\neq$ Resolution Initiation by default.

Pending Initiation

Initiation may remain Pending while authority, conditions, Subject participation, or other required elements remain unresolved.

Unknown Initiation

Where available information cannot establish whether Resolution governance has legitimately begun, the state should remain Unknown.

Therefore:

Unknown Resolution Initiation $\neq$ No Resolution Initiation.

Uncertain Initiation

Where multiple plausible interpretations exist, uncertainty should remain explicit.

Therefore:

Uncertain Initiation $\neq$ Authority to Select a Preferred Resolution Pathway.

Disputed Initiation

Subjects may dispute whether a Resolution process has legitimately commenced.

The dispute should remain explicit.

Therefore:

Disputed Initiation $\neq$ Governed Resolution Initiation.

Initiation Effective Time

LRSIM should identify when Resolution Initiation becomes effective.

Trigger Time vs Initiation Time

The triggering event and effective initiation may occur at different times.

Therefore:

Resolution Trigger Time $\neq$ Resolution Initiation Effective Time by default.

Proposal Time vs Initiation Time

A proposal may precede actual initiation.

Therefore:

Resolution Proposal Time $\neq$ Resolution Initiation Time by default.

Recording Time vs Initiation Time

The process may be recorded after it began.

Therefore:

Resolution Recording Time $\neq$ Resolution Initiation Effective Time by default.

Retrospective Initiation Identification

A process may be identified retrospectively as having entered Resolution governance earlier.

The later identification should not overwrite the actual effective time.

Resolution Initiation Evidence

Evidence may support:

the Trigger, Resolution Object, Subject participation, Basis, Scope, conditions, authority, or effective time.

Evidence does not itself establish Resolution.

Evidence vs Initiation

Evidence that payment or performance occurred does not automatically prove that a complete Resolution process was initiated.

Therefore:

Evidence of Resolution-Relevant Event $\neq$ Resolution Initiation by default.

Initiation Rationale

LRSIM should preserve why the active Liability has been routed into Resolution governance.

The rationale should identify the relevant Trigger, Object, Basis, Scope, and pathway.

Rationale vs Outcome

The rationale for initiation does not establish the final Resolution outcome.

Therefore:

Resolution Initiation Rationale $\neq$ Liability Resolution Determination.

Initiation Provenance

The module should preserve sufficient provenance to reconstruct:

the active Liability structure, Trigger, Resolution Object, Subjects, Relationship, Basis, Scope, Boundary, conditions, authority, time, and supporting inputs.

Multiple Initiation Events

One Liability Relationship may receive multiple Resolution-Relevant Events.

Those events should not automatically create multiple Resolution processes.

Therefore:

Multiple Resolution-Relevant Events $\neq$ Multiple Resolution Processes by default.

Duplicate Initiation Records

Different systems may record the same initiation.

Duplicate records should not create artificial Resolution processes.

Therefore:

Multiple Initiation Records $\neq$ Multiple Resolution Initiations by default.

Conflicting Initiation Records

Where records disagree on whether, when, or how Resolution began, the conflict should remain explicit.

Therefore:

Conflicting Initiation Records ≠ One Governed Initiation by default.

Initiation Change

A Resolution Initiation Structure may change before subsequent Resolution governance is complete.

Changes may concern:

Scope, Subjects, Object, pathway, conditions, authority, or dependencies.

Initiation Expansion

A Resolution process may legitimately expand to additional Liability requirements.

The expansion should be explicit and historically preserved.

Therefore:

Resolution Scope Expansion ≠ Original Resolution Scope.

Initiation Contraction

A Resolution process may be narrowed.

Excluded Liability requirements should remain active unless independently resolved.

Initiation Withdrawal

A Resolution process may be withdrawn or cease before Resolution.

Withdrawal should not be represented as Resolution.

Therefore:

Resolution Initiation Withdrawal ≠ Liability Resolution.

Initiation Supersession

A later Resolution process may supersede an earlier initiation structure.

The earlier structure should remain historically reconstructable.

Therefore:

Initiation Supersession ≠ Historical Deletion.

Primary Liability Preservation

Entering Resolution governance should not alter the underlying Liability merely because Resolution has begun.

Therefore:

Resolution Initiation ≠ Primary Liability Redetermination.

Liability Scope Preservation

Resolution Initiation should not silently alter established Liability Scope.

Therefore:

Resolution Scope ≠ Revised Liability Scope.

Liability Allocation Preservation

Initiation should not silently reallocate Liability among Subjects.

Therefore:

Resolution Initiation ≠ Liability Reallocation.

Transfer & Recourse Preservation

Where Transfer, Sharing, or Recourse structures exist, LRSIM should preserve them unless the Resolution process explicitly and legitimately affects them.

No Automatic Network Resolution

Initiating Resolution for one Relationship should not alter unrelated network Relationships.

Therefore:

Local Resolution Initiation $\neq$ Liability Network Resolution.

Historical Integrity

The pre-initiation Liability state should remain reconstructable after Resolution governance begins.

Therefore:

Resolution Initiation $\neq$ Historical Rewrite.

Upstream Re-Entry

If initiation reveals a material defect in an earlier LIGA™ governance space, governance should return to the earliest materially affected space.

The canonical rule is:

Re-enter the earliest materially affected governance space.

Targeted Reassessment

The governing principle is:

Reassess what materially changed. Preserve what remains valid.

Re-Entry Integrity

Re-entry should preserve the fact that Resolution Initiation occurred and why reassessment became necessary.

Therefore:

Re-entry must not rewrite history.

Automated Resolution Initiation

AI or automated systems may assist with:

detecting payment, detecting performance, identifying Settlement proposals, mapping Resolution Objects, identifying affected Relationships, classifying pathways, tracking conditions, and detecting conflicts.

Automation should not independently convert a Resolution-Relevant Event into authoritative Resolution.

Therefore:

Automated Resolution Initiation Classification $\neq$ Authoritative Liability Resolution.

Governed Liability Resolution Initiation Structure

The principal output of LRSIM is:

Governed Liability Resolution Initiation Structure

It should identify, where applicable:

Liability Origin, active Liability Relationship, Resolution Initiation identity, Resolution-Relevant Event, Resolution Trigger, Resolution Object, affected Subjects, Subject roles, affected Relationships, preliminary Resolution Basis, Resolution Scope, Resolution Boundary, remaining active Liability, Resolution pathway, conditions, dependencies, authority, initiation State, effective time, payment association, performance association, Settlement association, Discharge relevance, release or waiver relevance, Extinguishment relevance, uncertainty, disputes, conflicts, rationale, provenance, and initiation history.

Meaning of the Output

A Governed Liability Resolution Initiation Structure means that an active Liability requirement has been sufficiently identified and bounded for Resolution governance to proceed.

It does not mean that Liability has been satisfied, settled, discharged, resolved, or finalized.

Therefore:

Governed Liability Resolution Initiation Structure $\neq$ Governed Liability Resolution & Discharge State.

Downstream Handoff

Depending on the applicable pathway, the Governed Liability Resolution Initiation Structure may proceed through:

LSATM — Liability Satisfaction Module

LSETM — Liability Settlement Module

and subsequently:

LDCHM — Liability Discharge Module

before final LRDS verification under:

LRVFM — Liability Resolution Verification Module

The exact pathway depends on the governed Resolution structure.

Minimum Implementation Framework

A conforming implementation of LRSIM must provide exactly the following eight capabilities:

Active Liability & Resolution-Relevant Event Association

Capability to associate Resolution Initiation with an established active Liability structure and identify the event, process, condition, proposal, or mechanism creating Resolution relevance.

Resolution Object, Subject & Relationship Identification

Capability to identify exactly what Liability requirement enters Resolution governance, which Subjects participate, their relevant roles, and which Liability Relationships are affected.

Resolution Basis, Scope & Boundary Governance

Capability to establish the preliminary Resolution Basis, define complete or partial Resolution Scope, distinguish affected from unaffected Liability, and prevent unbounded Resolution interpretation.

Resolution Pathway, Condition & Dependency Governance

Capability to identify Satisfaction, Settlement, Discharge, Extinguishment, release, waiver, or other applicable pathways and represent their conditions and dependencies without treating pathway identification as Resolution.

Authority, State & Temporal Governance

Capability to identify Resolution Initiation authority, authority boundaries, initiation State, Trigger time, effective time, proposal time, recording time, and relevant uncertainty or dispute.

Payment, Performance, Settlement & External-Event Distinction Governance

Capability to distinguish Resolution Initiation from payment, performance, Settlement proposal, Claim closure, Harm Resolution, operational termination, administrative closure, and other Resolution-relevant events.

Historical Integrity, Provenance, Change & Re-Entry Governance

Capability to preserve pre-initiation Liability state, initiation rationale, provenance, expansion, contraction, withdrawal, supersession, conflict, and targeted upstream re-entry without rewriting history.

LRDS Resolution Pathway Handoff Governance

Capability to produce a Governed Liability Resolution Initiation Structure sufficiently explicit, bounded, traceable, and historically preserved for subsequent Satisfaction, Settlement, Discharge, and Resolution Verification governance.

Governance Logic

The canonical LRSIM governance logic is:

Active Liability Structure

↓

Identify Resolution-Relevant Event

↓

Identify Resolution Trigger

↓

Identify Resolution Object

↓

Identify Affected Liability Relationship

↓

Identify Subjects & Roles

↓

Identify Preliminary Resolution Basis

↓

Establish Resolution Scope

↓

Establish Resolution Boundary

↓

Identify Remaining Active Liability

↓

Identify Resolution Pathway

↓

Identify Conditions & Dependencies

↓ Identify Authority where required ↓

Establish Initiation State & Effective Time

↓

Distinguish Payment / Performance / Settlement / Closure from Resolution

↓

Preserve Uncertainty / Dispute / Conflict

↓

Preserve Rationale / Provenance / History

Governed Liability Resolution Initiation Structure

Handoff to Subsequent LRDS Governance

Governance Outputs

LRSIM may produce:

Resolution Initiation Identity

Resolution-Relevant Event Record

Resolution Trigger

Resolution Object

Affected Liability Relationship

Affected Subject Structure

Subject Role Structure

Preliminary Resolution Basis

Resolution Scope

Resolution Boundary

Remaining Active Liability Record

Resolution Pathway

Resolution Condition Structure

Resolution Dependency Structure

Resolution Authority Association

Resolution Initiation State

Resolution Initiation Effective Time

Payment Association

Performance Association

Settlement Association

Discharge-Relevance Record

Extinguishment-Relevance Record

Release / Waiver Relevance Record

Initiation Conflict Record

Initiation Rationale

Initiation Provenance

Initiation History

The principal output is:

Governed Liability Resolution Initiation Structure

Critical Distinctions

LRSIM preserves the following distinctions:

Resolution-Relevant Event ≠ Liability Resolution Resolution Initiation ≠ Liability Resolution Resolution Trigger ≠ Resolution Completion Liability Basis ≠ Resolution Initiation Basis by default Resolution Object ≠ Liability Object by default Partial Resolution Object ≠ Complete Liability Relationship One Resolution Process ≠ One Resolution Object by default Liability-Bearing Subject ≠ Resolution-Performing Subject by default Paying Subject ≠ Liability-Bearing Subject by default Performing Subject ≠ Liability-Bearing Subject by default Multi-Subject Resolution Initiation ≠ Uniform Subject Resolution Resolution Initiation for Relationship A ≠ Resolution Initiation for Relationship B Primary Liability Resolution Initiation ≠ Recourse Resolution Initiation Local Resolution Initiation ≠ Liability Network Resolution Initiation Resolution Scope ≠ Liability Scope by default Resolution Initiation ≠ Authority to Resolve Unbounded Liability Resolution Initiation ≠ Suspension of All Liability by default Resolution Pathway ≠ Resolution Outcome One Liability Requirement ≠ One Resolution Pathway by default Conditional Resolution Initiation ≠ Conditional Resolution Completion Resolution Dependency ≠ Resolution Condition Satisfaction Resolution Initiation Authority ≠ Resolution Completion Authority by default Local Resolution Authority ≠ Universal Liability Resolution Authority Payment ≠ Liability Resolution by default Partial Payment ≠ Complete Resolution Third-Party Payment ≠ Liability Transfer by default Performance ≠ Satisfaction by default Settlement Proposal ≠ Settlement Settlement Agreement ≠ Liability Resolution by default Settlement Initiation ≠ Admission of Liability Discharge-Relevant Event ≠ Liability Discharge Claim Closure ≠ Liability Resolution Harm Resolution ≠ Liability Resolution Operational Termination ≠ Liability Resolution Contract Termination ≠ Liability Resolution Administrative Closure ≠ Verified Liability Resolution Resolution Proposal ≠ Resolution Initiation by default Unknown Resolution Initiation ≠ No Resolution Initiation Uncertain Initiation ≠ Authority to Select a Preferred Resolution Pathway Disputed Initiation ≠ Governed Resolution Initiation Resolution Trigger Time ≠ Resolution Initiation Effective Time by default Resolution Proposal Time ≠ Resolution Initiation Time by default Resolution Recording Time ≠ Resolution Initiation Effective Time by default Evidence of Resolution-Relevant Event ≠ Resolution Initiation by default Resolution Initiation Rationale ≠ Liability Resolution Determination Multiple Resolution-Relevant Events ≠ Multiple Resolution Processes by default Multiple Initiation Records ≠ Multiple Resolution Initiations by default Conflicting Initiation Records ≠ One Governed Initiation by default Resolution Scope Expansion ≠ Original Resolution Scope Resolution Initiation Withdrawal ≠ Liability Resolution Initiation Supersession ≠ Historical Deletion Resolution Initiation ≠ Primary Liability Redetermination Resolution Scope ≠ Revised Liability Scope Resolution Initiation ≠ Liability Reallocation Local Resolution Initiation ≠ Liability Network Resolution Resolution Initiation ≠ Historical Rewrite Automated Resolution Initiation Classification ≠ Authoritative Liability Resolution Governed Liability Resolution Initiation Structure ≠ Governed Liability Resolution & Discharge State

Cross-Architecture Boundary

LRSIM may receive Resolution-relevant inputs from adjacent OOF® architectures.

ORA™ may establish payment, performance, termination, or other Operational Reality.

HAGA™ may establish Harm Recovery or Harm Resolution.

AGA™ may establish Responsibility, Accountability, Authority, or completion of a responsibility.

ADIT® may provide evidence and auditability.

VALIDOS™ may validate Resolution-relevant inputs.

OBIDENTITY® may provide identity, authority, succession, and provenance.

VFM® may establish economic or Value Flow events.

AIG® and ASGA™ may establish AI or autonomous-system operational events.

These inputs may create Resolution relevance.

They do not establish Liability Resolution.

The canonical interoperability principle is:

An external event may trigger Liability Resolution governance, but LRSIM governs whether an active Liability requirement has legitimately entered that governance process and what exactly the process concerns.

Canonical Boundary

LRSIM begins when an active Liability structure encounters an event, process, proposal, condition, agreement, performance, payment, authoritative action, or other mechanism capable of creating Resolution relevance.

LRSIM governs:

Resolution-Relevant Events, Resolution Triggers, Resolution Objects, affected Subjects, Subject roles, affected Liability Relationships, preliminary Resolution Basis, Scope, Boundary, remaining active Liability, Resolution pathways, conditions, dependencies, authority, initiation States, effective time, payment relevance, performance relevance, Settlement relevance, Discharge relevance, Extinguishment relevance, release or waiver relevance, uncertainty, disputes, conflicts, rationale, provenance, history, and downstream routing.

LRSIM does not independently determine:

Satisfaction, Settlement completion, Discharge, complete Resolution, or Finality.

LRSIM ends when the Resolution process is sufficiently represented as a:

Governed Liability Resolution Initiation Structure

for subsequent LRDS governance.

Use Case 1 — Payment Initiates Partial Resolution

Governance

An established Liability Relationship contains a monetary requirement and a separate corrective performance requirement.

The monetary amount is paid.

LRSIM identifies the payment as a Resolution-Relevant Event and establishes the monetary requirement as the Resolution Object.

The corrective performance requirement remains outside the Resolution Boundary and continues as active Liability.

The payment therefore initiates Resolution governance for one component without treating the complete Liability Relationship as resolved.

Use Case 2 — Settlement Proposal Across Multiple Liability

Relationships

Two Subjects participate in several Liability Relationships arising from the same wider matter.

A Settlement proposal is made concerning only one of those Relationships.

LRSIM identifies:

the proposal, the exact affected Liability Relationship, the participating Subjects, the proposed Resolution Scope, the preliminary Settlement pathway, and the Relationships remaining outside the process.

The Settlement proposal does not initiate network-wide Resolution and does not constitute an admission of Liability.

Canonical Closing Statement

Resolution must begin somewhere, but beginning Resolution is not the same as achieving it.

A payment may trigger the process.

Performance may trigger the process.

A Settlement proposal may trigger the process.

A Discharge mechanism may trigger the process.

But the Liability remains governed until the applicable Resolution requirements are actually satisfied.

LRSIM establishes the boundary between active Liability and the process intended to resolve it without confusing that boundary with the outcome.

Resolution-Relevant Event $\neq$ Liability Resolution.

Define what enters Resolution governance before deciding whether anything has actually been resolved.
