

LSTHM — Liability State History Module

LSTHM — Liability State History Module

Architecture: LIGA™ — Liability Governance Architecture
Parent Standard: Liability State & Change Standard (LSCS)
Category: Governance & Enforcement
Subcategory: Liability Governance
Type: Core Module
Governed Space: Liability State History
Module ID: LIGA-LSCS-LSTHM-001
Origin ID: OOF.CM.LIGA.09.05.01
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 24 September 2026
Compatibility: OOF® Methodology OS™ · Modular OOF® Architecture Ecosystem
AI-Readable: Yes
Authority: OOF® — OriginOpen® Foundation
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL™)

Canonical Definition

The Liability State History Module (LSTHM) governs how Liability States, State Transitions, identified and assessed Liability Changes, corrections, reassessments, supersessions, reversals, unresolved states, re-entry events, and downstream routing decisions are preserved as a continuous and reconstructable Liability State history.

LSTHM ensures that the current Liability State does not replace or erase the governed states that preceded it.

It preserves the temporal, relational, structural, methodological, and authority context necessary to reconstruct how Liability moved from one governed state to another and why the current state exists.

LSTHM does not determine Liability, create a State Transition, identify a new Change, or assess the substantive effect of a Change.

It governs historical continuity after those governance actions occur.

It governs the transition:

Governed Liability State + Governed Liability State Transition + Assessed Liability Change → Historical Association → State Sequence → Change & Transition Record → Supersession / Correction / Reassessment Preservation → Re-Entry & Routing History → Governed Liability State History Its foundational distinction is:

Current Liability State ≠ Complete Liability History.

Operational Role

The operational role of LSTHM is:

to preserve how Liability reached its current state without allowing later states, corrections, reassessments, or lifecycle re-entry to erase the governed states that came before them.

LSTIM identifies the current state.

LSTTM governs transitions between states.

LCHIM identifies Liability Change.

LCHAM assesses the effect of that Change.

LSTHM preserves the resulting history.

Position in the LSCS Internal Flow

The internal LSCS progression is:

Liability State Identification → Liability State Transition → Liability Change Identification → Liability Change Assessment → Liability State History LSTHM governs:

Liability State History

Its principal inputs may include:

Governed Liability State

Governed Liability State Transition

Identified Liability Change

Assessed Liability Change

Its principal output is:

Governed Liability State History

This output supports continuing Liability State governance and any legitimate downstream routing or lifecycle re-entry.

Central Operational Question

How must Liability States, transitions, changes, assessments, corrections, reassessments, and re-entry events be preserved so that the current Liability structure remains historically reconstructable?

Liability State History Object

Every Liability State History should identify the Liability structure whose history is being preserved.

The History Object may concern:

a complete Liability Relationship, a Subject-specific Liability, a Scope portion, an Allocation, an obligation, a Liability Network component, or another explicitly governed Liability structure.

Historical Identity

The history should possess sufficient identity to distinguish it from:

another Liability, another Relationship, another Subject, another Liability Object, another historical sequence, or another lifecycle.

Liability Origin Association

The State History should remain associated with the Liability Origin from which the governed Liability developed.

Therefore:

State History without Liability Origin ≠ Complete Liability History.

Determination Association

State History should preserve its relationship to the Liability Determination that established the Liability.

Historical State governance must not detach current Liability from its original Determination structure.

Scope Association

Historical States should remain associated with the Scope that applied during the relevant period.

A later Scope should not silently replace the historical Scope.

Therefore:

Current Scope ≠ Historical Scope by default.

Allocation Association

Where Allocation changed over time, the State History should preserve which Allocation applied during each materially relevant period.

Therefore:

Current Allocation $\neq$ Historical Allocation by default.

Subject Association

Historical Liability States should remain associated with the Subjects to whom they applied.

A later Subject change should not rewrite historical Subject relationships.

Relationship Association

Historical states should remain connected to the Liability Relationships within which they existed.

Therefore:

Current Relationship Structure $\neq$ Historical Relationship Structure by default.

Object and Basis Association

Where materially relevant, State History should preserve the Liability Object and Liability Basis applicable to each historical state.

State History Entry

Each material historical state should be represented through a distinct State History Entry.

A State History Entry may include:

State Identity, State classification, State object, effective period, Subject, Relationship, Scope, Allocation, obligation, dependencies, authority, rationale, provenance, and transition association.

Historical State Sequence

LSTHM should preserve the sequence in which governed Liability States became operative.

The sequence may be represented as:

State A $\rightarrow$ State B $\rightarrow$ State C $\rightarrow$ Current State where each transition remains reconstructable.

Sequence Integrity

Historical ordering should reflect governed effective time rather than merely database entry order.

Therefore:

Record Order $\neq$ Liability State Order by default.

Current State

The Current Liability State should be explicitly distinguishable from historical states.

The current state is the presently operative state.

It is not the complete Liability history.

Historical State

A Historical Liability State is a state that applied during an earlier governed period.

Historical does not mean incorrect.

Therefore:

Historical State $\neq$ Invalid State.

Superseded State

A Superseded State was legitimately replaced by another governed state.

It remains part of the historical record.

Therefore:

State Supersession $\neq$ Historical Deletion.

Corrected State

Where an earlier State Identification or record was incorrect, the correction should identify:

the earlier representation, the corrected representation, the correction basis, the correction time, and the applicable historical effect.

Correction Integrity

Correction should not cause the earlier record to disappear.

Therefore:

State Correction $\neq$ Historical Erasure.

Reassessed State

A state may be reassessed because new governed information or circumstances become available.

A reassessed state should remain distinguishable from a corrected state.

Therefore:

State Reassessment $\neq$ State Correction.

Reversed State

A later governed process may reverse an earlier state effect.

The earlier state should remain preserved.

Therefore:

State Reversal $\neq$ State Deletion.

Unknown Historical State

Where a historical state cannot be reliably reconstructed, the gap should remain explicit.

Therefore:

Unknown Historical State $\neq$ No Historical State.

Uncertain Historical State

Where multiple historical states remain plausible, uncertainty should be preserved.

Historical reconstruction should not manufacture certainty.

Disputed Historical State

Where materially competing governed accounts exist concerning a historical Liability State, the dispute should remain represented.

Therefore:

Disputed Historical State $\neq$ Authority to Select a Preferred History.

Historical Gap

A missing portion of Liability State history should be explicitly identifiable.

A system should not silently bridge an unknown interval.

Therefore:

Historical Gap $\neq$ State Continuity by assumption.

State Effective Period

Every material historical state should preserve the period during which it governed where this can be established.

State Start Time

State Start Time identifies when a historical state became operative.

State End Time

State End Time identifies when a historical state ceased to be operative.

Observation Time

The time a state was observed may differ from when it became effective.

Therefore:

State Observation Time $\neq$ Historical State Effective Time by default.

Recording Time

The time a historical state was entered into a system may differ from its effective period.

Therefore:

State Recording Time $\neq$ Historical State Effective Time by default.

Discovery Time

A historical state may be discovered only after its operative period.

The discovery time should not replace the historical effective time.

Retrospective Reconstruction

A later governance process may reconstruct an earlier Liability State.

The system should distinguish:

the historical state being reconstructed, the time it applied, and the later time at which it was reconstructed.

Retrospective Integrity

Therefore:

Retrospective Reconstruction $\neq$ Historical Rewrite.

The purpose is to improve historical representation, not to pretend the later knowledge existed earlier.

State Transition History

Every material State Transition should remain associated with:

Source State, Target State, trigger, conditions, authority where applicable, effective time, rationale, and provenance.

Transition Chain

LSTHM should preserve the sequence of transitions connecting historical states.

Example:

Active $\rightarrow$ Suspended $\rightarrow$ Active $\rightarrow$ Under Reassessment $\rightarrow$ Modified Each transition remains a separate governed event.

Transition Chain Integrity

The current state should remain traceable through the transition chain to earlier states.

Therefore:

Current State $\neq$ Complete Transition Chain.

Failed Transition History

A transition that was evaluated but legitimately failed may remain relevant to the Liability history.

Where material, the failure should be preserved.

Cancelled Transition History

A planned or pending transition that was later cancelled should remain distinguishable from a transition that never existed.

Reversed Transition History

Where a completed transition was later reversed, both the original transition and the reversal should remain reconstructable.

Superseded Transition History

A transition may be superseded by later governance.

Supersession should not delete the earlier transition.

Change History

LSTHM should preserve material Liability Changes associated with State history.

The Change record should remain distinguishable from the State and Transition records.

Therefore:

Liability Change $\neq$ Liability State History Entry by itself.

Change Identification History

Where LCHIM identified a potential Liability Change, that identification may remain historically relevant even if later assessment determines that no Liability modification was required.

Change Assessment History

LSTHM should preserve the outcome of material Change Assessments.

Possible historical outcomes may include:

No Material Liability Effect, State Change Required, Upstream Reassessment Required, Scope Reassessment Required, Allocation Reassessment Required, Transfer & Recourse Routing Required, Resolution & Discharge Routing Required, Unknown Effect, Uncertain Effect, or Disputed Effect.

No-Change Assessment History

A formal assessment concluding that Liability remained unchanged may itself be historically material.

Therefore:

No Liability Change $\neq$ No Governance Event.

Change Effective Time History

Where an assessed Change affects Liability from a specific time, that effective time should remain preserved separately from Change discovery and assessment time.

Change Sequence

Multiple Liability Changes should remain ordered according to their relevant temporal and structural relationships.

Parallel Change History

Several Changes may occur in parallel.

Parallel Changes should remain separately identifiable where their Liability effects differ.

Composite Change History

Where several Changes were governed as one Composite Change, both the composite structure and its material constituent Changes should remain reconstructable.

Liability Network History

A Liability Network may contain multiple Relationships with different State histories.

LSTHM should preserve those histories separately while maintaining their network association.

Local History vs Network History

Therefore:

One Liability Relationship History $\neq$ Complete Liability Network History.

Network State History

Where a network-level state is represented, the underlying Relationship states should remain accessible.

A network-level summary should not erase local state variation.

Historical Propagation

Where a State Transition or Change propagated from one Liability component to another, the propagation path should remain reconstructable.

Propagation Origin

The originating Change or Transition should remain identifiable.

Therefore:

Propagated State $\neq$ Independent State Origin by default.

Re-Entry History

Where Liability governance re-entered an earlier LIGA™ governance space, the re-entry should be preserved.

The history should identify:

why re-entry occurred, which governance space was re-entered, what structure was reassessed, what remained valid, and what changed afterward.

Earliest Materially Affected Space

Where re-entry occurs, the historical record should identify the governance space selected under the principle:

Re-enter the earliest materially affected governance space.

Re-Entry Continuity

Re-entry should remain connected to the existing Liability lifecycle unless legitimate governance establishes a distinct new Liability Origin.

Therefore:

Lifecycle Re-Entry $\neq$ New Liability Origin by default.

Re-Entry Historical Integrity

The canonical rule is:

Re-entry must not rewrite history.

The pre-re-entry state remains part of the governed Liability history even where subsequent reassessment changes the current structure.

Preserving Unaffected Governance

Where re-entry affects only part of the Liability structure, the historical record should identify which governance remained valid.

The canonical principle is:

Reassess what materially changed. Preserve what remains valid.

Upstream Reassessment History

Where a Change required reassessment of:

Context, Object, Basis, Relationships, Conditions, Connection, Determination, Scope, or Allocation, the re-entry and resulting downstream consequences should remain historically linked.

Downstream Routing History

Where a Liability State or Change creates downstream routing, the routing decision should remain historically identifiable.

Possible destinations include:

LTRS — Liability Transfer & Recourse Standard

and:

LRDS — Liability Resolution & Discharge Standard

Routing ≠ Completion

A historical routing record does not mean the downstream governance process was completed.

Therefore:

Transfer Routing ≠ Liability Transfer.

Resolution Routing ≠ Liability Resolution.

Transfer & Recourse History Association

Where Liability enters Transfer or Recourse governance, LSTHM should preserve the state from which that downstream process originated.

This allows secondary Liability structures to remain connected to their primary Liability history.

Resolution & Discharge History Association

Where Liability enters Resolution & Discharge governance, the originating Liability State should remain identifiable.

This prevents Resolution from becoming detached from the Liability that was being resolved.

Finality Boundary

LSTHM preserves State history but does not determine Liability Finality.

Therefore:

Complete State History ≠ Liability Finality.

Finality belongs to LCFS.

Historical Continuity vs Finality

Historical continuity persists even after active Liability governance eventually reaches Finality.

Therefore:

Liability Finality ≠ Liability History Erasure.

Claim History Boundary

Claim history may interact with Liability history but remains distinct.

Therefore:

Claim History ≠ Liability History.

Claim opening, payment, rejection, closure, or reopening should not silently rewrite Liability State history.

Harm History Boundary

Harm history remains governed separately by HAGA™.

Therefore:

Harm History ≠ Liability History.

A Harm state may change independently of Liability State history.

Responsibility & Accountability History Boundary

Responsibility and Accountability histories remain separate governed structures.

Therefore:

Responsibility History ≠ Liability History.

Accountability History ≠ Liability History.

Payment History Boundary

Payment history may become relevant to Liability State or Resolution governance.

It does not replace Liability State history.

Therefore:

Payment History ≠ Liability History.

Insurance History Boundary

Insurance coverage and payment history remain separate from substantive Liability history.

Therefore:

Insurance History ≠ Liability History.

Operational History Boundary

Operational system history may provide relevant inputs.

It does not become Liability history merely because the operational system was associated with the Liability.

Therefore:

Operational History ≠ Liability History.

Historical Provenance

Every material historical record should preserve sufficient provenance to identify:

its source, the Liability structure it concerns, the time it applies, the authority where relevant, the methodology or governance action that produced it, and its relationship to preceding and subsequent records.

Historical Traceability

A qualified reviewer should be able to reconstruct:

Liability Determination → Scope & Allocation → State → Transition → Change → Assessment → New State → ReEntry / Routing where applicable without reconstructing the matter from unstructured raw information.

Historical Rationale

Material transitions, corrections, reassessments, and routing decisions should preserve their rationale.

Therefore:

Historical Record ≠ Historical Rationale by default.

Historical Authority

Where a historical state or transition depended upon an authority, that authority relationship should remain preserved.

A later authority structure should not overwrite the historical authority context.

Historical Evidence Association

Evidence supporting a historical state, transition, or Change Assessment should remain associable with the relevant historical object.

Evidence should not be confused with the history itself.

Historical Versioning

Material updates to Liability State History should preserve prior versions or equivalent reconstructable records where necessary.

Therefore:

History Update ≠ Historical Replacement.

Historical Correction

Errors in historical representation may be corrected.

The correction should preserve:

what was previously recorded, what was corrected, why it was corrected, when the correction occurred, and what historical period the correction affects.

Historical Integrity

LSTHM should prevent:

silent deletion, silent overwriting, silent backdating, untraceable state replacement, untraceable transition replacement, and untraceable lifecycle re-entry.

Historical Immutability vs Correctability

Historical integrity does not require that an incorrect record remain uncorrectable.

The correct principle is:

Historical Preservation ≠ Historical Immutability.

A record may be corrected while the correction itself remains visible and reconstructable.

State History Reconstruction

A system should be capable of reconstructing the Liability State applicable at a materially relevant historical point or period where sufficient governed information exists.

Point-in-Time Reconstruction

Point-in-Time Reconstruction determines the governed Liability State at a defined historical moment.

This may require consideration of:

effective times, retrospective corrections, supersessions, and re-entry outcomes.

Period Reconstruction

Period Reconstruction determines how Liability State changed across a defined interval.

The result should preserve transitions rather than presenting only beginning and ending states.

Historical Uncertainty

Where historical reconstruction cannot reach sufficient certainty, uncertainty should remain explicit.

Therefore:

Incomplete Historical Evidence $\neq$ Authority to Manufacture State History.

State History Consistency

Historical records should remain internally coherent across:

State identities, effective times, transitions, Changes, assessments, Subjects, Relationships, Scope, Allocation, and downstream routing.

Historical Conflict

Where historical sources conflict, the conflict should remain identifiable until legitimately resolved.

Therefore:

Conflicting Historical Records $\neq$ One Historical Truth by default.

Duplicate Historical Records

Multiple records may represent the same historical State or Transition.

Duplicate records should not create duplicate Liability history.

Therefore:

Multiple Historical Records $\neq$ Multiple Historical Events by default.

Automated Historical Governance

AI or automated systems may support:

timeline reconstruction, state sequencing, change association, transition mapping, version comparison, conflict detection, and provenance analysis.

Automation should preserve uncertainty and source boundaries.

Therefore:

Automated Historical Reconstruction $\neq$ Authoritative Liability History by default.

Machine-Readable State History

Where implemented digitally, State History should support machine-readable representation of:

state identity, state type, effective period, Subjects, Relationships, Scope, Allocation, transitions, Changes, assessments, re-entry, routing, provenance, and unresolved states.

Machine readability should not reduce methodological meaning.

Governed Liability State History

The principal output of LSTHM is:

Governed Liability State History

It should preserve, where applicable:

Liability Origin, Liability Determination association, historical Subjects, historical Relationships, historical Objects and Bases, historical Scope, historical Allocation, State identities, State classifications, State effective periods, Transition identities, Transition chains, Change identities, Change assessments, corrections, reassessments, reversals, supersessions, unknown states, uncertain states, disputed states, historical gaps, re-entry events, propagation paths, downstream routing, authority, rationale, provenance, and current State association.

Meaning of the Output

A Governed Liability State History means that the evolution of established Liability through State and Change governance is sufficiently preserved to reconstruct how the current Liability structure emerged.

It does not mean that Liability has reached Resolution, Discharge, or Finality.

Therefore:

Governed Liability State History ≠ Liability Lifecycle Completion.

LSCS Completion Function

LSTHM completes the internal LSCS module sequence:

LSTIM — Liability State Identification Module

↓

LSTTM — Liability State Transition Module

↓

LCHIM — Liability Change Identification Module

↓

LCHAM — Liability Change Assessment Module

↓

LSTHM — Liability State History Module

The combined LSCS output is:

Governed Liability State & Change Structure

This structure may continue into:

LTRS — Liability Transfer & Recourse Standard

LRDS — Liability Resolution & Discharge Standard

or:

targeted lifecycle re-entry as applicable.

Minimum Implementation Framework

A conforming implementation of LSTHM must provide exactly the following eight capabilities:

Liability State History Identity & Lifecycle Association

Capability to preserve State History identity and associate historical States with Liability Origin, Determination, Subjects, Relationships, Objects, Bases, Scope, Allocation, obligations, and applicable lifecycle structures.

State Sequence, Effective Period & Point-in-Time Reconstruction Governance

Capability to preserve historical State sequences, effective periods, start and end times, observation and recording distinctions, and reconstruct the governed Liability State at materially relevant historical points or periods.

Transition, Change & Assessment History Governance

Capability to preserve State Transitions, Transition Chains, identified Liability Changes, Change Assessments, no-change outcomes, propagation, and the relationships among those historical objects.

Correction, Reassessment, Reversal, Supersession & Version Governance

Capability to preserve corrected, reassessed, reversed, superseded, and updated states or assessments without deleting prior governed records.

Unknown, Uncertain, Disputed, Gap & Conflict History Governance

Capability to explicitly represent incomplete, uncertain, disputed, missing, duplicated, or conflicting historical information without manufacturing certainty or false continuity.

Re-Entry, Origin Continuity & Unaffected-Governance Preservation

Capability to preserve lifecycle re-entry, identify the earliest materially affected governance space, maintain Liability Origin continuity, preserve unaffected governance, and prevent historical rewriting.

Downstream Routing, Network History, Provenance & Traceability Governance

Capability to preserve Transfer & Recourse and Resolution & Discharge routing, multi-Relationship and Liability Network histories, authority, rationale, provenance, evidence association, and reconstructable traceability.

LSCS Completion & Lifecycle Continuation Governance

Capability to produce a Governed Liability State History that completes the LSCS State & Change structure and supports legitimate continuation into Transfer & Recourse, Resolution & Discharge, or targeted lifecycle re-entry.

Governance Logic

The canonical LSTHM governance logic is:

Governed Liability State

Governed Liability State Transition

Identified / Assessed Liability Change

↓

Identify Historical Object

↓

Associate Liability Origin & Determination

↓

Associate Subject / Relationship / Scope / Allocation

↓

Establish Effective Period

↓

Preserve State Sequence

↓

Preserve Transition Chain

↓

Associate Change & Assessment

↓

Preserve Correction / Reassessment / Reversal / Supersession

↓

Preserve Unknown / Uncertain / Disputed / Gap States

↓

Preserve Re-Entry & Origin Continuity

↓

Preserve Propagation & Network Relationships

↓

Preserve Downstream Routing

↓

Preserve Authority / Rationale / Provenance

↓

Governed Liability State History

↓

Governed Liability State & Change Structure

Governance Outputs

LSTHM may produce:

Liability State History Identity

Historical State Entry

Current State Association

Historical State Sequence

State Effective Period Record

Point-in-Time Liability State

Period Liability State History

Transition History Record

Transition Chain

Failed Transition History

Cancelled Transition History

Reversed Transition History

Superseded Transition History

Liability Change History

Change Assessment History

No-Change Assessment Record

Correction History

Reassessment History

Reversal History

Supersession History

Unknown Historical State

Uncertain Historical State

Disputed Historical State

Historical Gap Record

Historical Conflict Record

Re-Entry History

Origin Continuity Record

Propagation History

Liability Network History

Transfer & Recourse Routing History

Resolution & Discharge Routing History

Historical Authority Record

Historical Rationale

Historical Provenance Record

The principal output is:

Governed Liability State History

which contributes to the LSCS output:

Governed Liability State & Change Structure

Critical Distinctions

LSTHM preserves the following distinctions:

Current Liability State ≠ Complete Liability History State History without Liability Origin ≠ Complete Liability History
Current Scope ≠ Historical Scope by default Current Allocation ≠ Historical Allocation by default Current Relationship
Structure ≠ Historical Relationship Structure by default Record Order ≠ Liability State Order by default Historical State
≠ Invalid State State Supersession ≠ Historical Deletion State Correction ≠ Historical Erasure State Reassessment ≠
State Correction State Reversal ≠ State Deletion Unknown Historical State ≠ No Historical State Disputed Historical
State ≠ Authority to Select a Preferred History Historical Gap ≠ State Continuity by assumption State Observation Time
≠ Historical State Effective Time by default State Recording Time ≠ Historical State Effective Time by default
Retrospective Reconstruction ≠ Historical Rewrite Current State ≠ Complete Transition Chain Liability Change ≠
Liability State History Entry by itself No Liability Change ≠ No Governance Event One Liability Relationship History ≠
Complete Liability Network History Propagated State ≠ Independent State Origin by default Lifecycle Re-Entry ≠ New
Liability Origin by default Re-entry ≠ Historical Rewrite Transfer Routing ≠ Liability Transfer Resolution Routing ≠
Liability Resolution Complete State History ≠ Liability Finality Liability Finality ≠ Liability History Erasure Claim History ≠
Liability History Harm History ≠ Liability History Responsibility History ≠ Liability History Accountability History ≠
Liability History Payment History ≠ Liability History Insurance History ≠ Liability History Operational History ≠ Liability
History Historical Record ≠ Historical Rationale by default History Update ≠ Historical Replacement Historical
Preservation ≠ Historical Immutability Incomplete Historical Evidence ≠ Authority to Manufacture State History
Conflicting Historical Records ≠ One Historical Truth by default Multiple Historical Records ≠ Multiple Historical Events
by default Automated Historical Reconstruction ≠ Authoritative Liability History by default Governed Liability State
History ≠ Liability Lifecycle Completion

Cross-Architecture Boundary

LSTHM may preserve references to governed historical inputs from other OOF® architectures where they materially informed Liability State or Change.

ORA™ may preserve relevant Operational Reality history.

HAGA™ may preserve Harm history.

AGA™ may preserve Responsibility and Accountability history.

ADIT® may preserve evidence and audit records.

VALIDOS™ may preserve validation history.

OBIDENTITY® may preserve Origin, Identity, Ownership, Authority, Provenance, Transfer, and Continuity history.

AIG® and ASGA™ may preserve AI or autonomous-system operational history.

VFM® may preserve Value Flow history.

PGA™ may preserve Prediction history.

SIMULOS® may preserve Simulation history.

Those histories remain governed within their original domains.

LSTHM preserves only their relevant association with Liability State and Change history.

The canonical interoperability principle is:

External history may explain Liability history without becoming Liability history and without transferring governance ownership of its original domain to LIGA™.

Canonical Boundary

LSTHM begins when one or more governed Liability States, State Transitions, identified Changes, or assessed Changes require historical preservation.

LSTHM governs:

State History identity, historical association, State sequences, effective periods, Transition history, Change history, Assessment history, corrections, reassessments, reversals, supersessions, Unknown historical states, Uncertain historical states, Disputed historical states, historical gaps, historical conflicts, re-entry history, Origin continuity, unaffected-governance preservation, propagation history, Liability Network history, downstream routing history, authority, rationale, provenance, traceability, historical versioning, and reconstruction.

LSTHM does not govern:

initial Liability Determination, new Scope or Allocation, State Transition creation, Change Identification, Change Assessment, Transfer, Recourse, Resolution, Discharge, or Finality.

LSTHM ends when the evolution of Liability through LSCS is sufficiently preserved as:

Governed Liability State History

within the broader:

Governed Liability State & Change Structure

Use Case 1 — Multi-Party Liability History

A multi-party Liability structure changes several times.

One Subject's Liability moves from Conditional to Active.

A second Subject's Liability remains Disputed.

A later reassessment changes one Scope portion and produces a new State for the first Subject.

LSTHM preserves:

the original States, the State Transition, the reassessment, the earlier Scope, the revised Scope, the effective times, the affected Relationships, and the current States.

The current record therefore does not create the false impression that the latest structure always existed.

A reviewer can reconstruct what Liability looked like at each materially relevant point in time.

Use Case 2 — Autonomous System Liability Re-Entry History

An autonomous system is involved in an established Liability Relationship.

The Liability is initially Active.

Later operational information triggers reassessment of an earlier Liability Condition.

The matter re-enters LCOS and subsequently passes again through the affected LIGA™ governance spaces.

The resulting current Liability State changes.

LSTHM preserves both the original lifecycle and the re-entry sequence.

The earlier State is not deleted merely because later governance reached a different result.

The module applies the canonical rule:

Re-entry must not rewrite history.

Canonical Closing Statement

A current Liability State tells us where Liability is now.

It does not tell us how Liability arrived there.

Every material State, Transition, Change, correction, reassessment, reversal, re-entry, and routing decision forms part of the governed Liability history.

That history must remain reconstructable even when the current Liability structure changes.

LSTHM ensures that Liability may evolve without allowing its past to disappear.

Current Liability State ≠ Complete Liability History.

Govern the present. Preserve the path that produced it.
