

LSTTM — Liability State Transition Module

LSTTM — Liability State Transition Module

Architecture: LIGA™ — Liability Governance Architecture
Parent Standard: Liability State & Change Standard (LSCS)
Category: Governance & Enforcement
Subcategory: Liability Governance
Type: Core Module
Governed Space: Liability State Transition
Module ID: LIGA-LSCS-LSTTM-001
Origin ID: OOF.CM.LIGA.09.02.01
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 24 September 2026
Compatibility: OOF® Methodology OS™ · Modular OOF® Architecture Ecosystem
AI-Readable: Yes
Authority: OOF® — OriginOpen® Foundation
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL™)

Canonical Definition

The Liability State Transition Module (LSTTM) governs how established Liability may move from one Governed Liability State to another through an explicit, bounded, authorized where required, temporally defined, traceable, and historically preserved State Transition.

LSTTM begins with a Governed Liability State and determines whether a proposed or triggered transition is structurally possible, what transition conditions apply, what Liability component the transition affects, when the transition becomes effective, and what resulting state should be established.

It preserves the distinction between a transition trigger and an actual State Transition.

It prevents operational events, record updates, payments, Claim changes, Harm changes, system changes, or other external events from being treated automatically as changes in Liability State.

LSTTM does not independently redefine Liability Determination, Scope, or Allocation.

It does not perform broader Liability Change identification or assessment where the underlying Liability structure itself may have changed.

It governs the transition:

Governed Liability State → Transition Trigger → Transition Eligibility → Transition Conditions → Transition Authority → Transition Execution → Resulting Liability State Its foundational distinction is:

Transition Trigger ≠ Liability State Transition.

Operational Role

The operational role of LSTTM is:

to govern whether, when, how, and to what extent an established Liability may legitimately move from its current state into another state.

LSTTM identifies the current state.

LSTTM governs movement from that state.

Where the issue concerns a broader material change to the underlying Liability structure, the matter proceeds into Liability Change governance.

Position in the LSCS Internal Flow

The internal LSCS progression is:

Liability State Identification → Liability State Transition → Liability Change Identification → Liability Change Assessment → Liability State History LSTTM governs:

Liability State Transition

Its principal input is:

Governed Liability State

Its principal output is:

Governed Liability State Transition

Its handoff is:

Governed Liability State Transition → LCHIM — Liability Change Identification Module

Central Operational Question

Under what governed conditions may the current Liability State legitimately transition into another state, and what resulting state becomes operative?

Transition Object

Every State Transition should identify the specific Liability component whose state may change.

The Transition Object may be:

the complete Liability Relationship, one Subject-specific Liability, one Scope portion, one Allocation, one obligation, one temporal segment, one Liability Network component, or another explicitly governed Liability component.

Transition Identity

Each material State Transition should possess sufficient identity to distinguish it from:

the current state, another transition, another Liability component, another Subject, another Relationship, another time period, and another Liability lifecycle.

Source State

Every State Transition begins from an identifiable Source State.

Therefore:

State Transition without Source State ≠ Fully Governed Transition.

The Source State should remain preserved after the transition occurs.

Target State

A transition should identify the state into which the relevant Liability component is expected or determined to move.

The Target State should be explicit or explicitly unresolved.

Source State and Target State

The canonical structure is:

Source Liability State → Governed Transition → Target Liability State The Target State does not replace the historical existence of the Source State.

Transition Trigger

A Transition Trigger is an event, condition, decision, time threshold, dependency change, or other governed occurrence capable of initiating State Transition evaluation.

A trigger does not itself establish the transition.

Therefore:

Transition Trigger ≠ Liability State Transition.

Trigger Identification

LSTTM should identify:

what triggered transition evaluation, when the trigger occurred, which Liability component it concerns, which Source State it may affect, and which transition pathway it potentially activates.

Trigger Source

A trigger may originate from:

a Liability Condition, an obligation, an authority action, a temporal event, a Scope or Allocation state, an external governed system, new information, a downstream process, or another materially relevant source.

External Trigger

An external event may trigger transition evaluation without becoming a Liability State Transition.

Therefore:

External Event $\neq$ Liability State Transition.

Operational Trigger

An operational system change, shutdown, activation, failure, restoration, or other operational event may trigger Liability review.

It does not automatically change Liability.

Therefore:

Operational Change $\neq$ Liability State Transition by default.

Harm Trigger

A change in Harm may become relevant to Liability State.

It does not automatically create an equivalent Liability transition.

Therefore:

Harm State Transition $\neq$ Liability State Transition.

Claim Trigger

A Claim event may trigger Liability State review.

Opening, accepting, rejecting, paying, closing, or reopening a Claim does not automatically establish a Liability State Transition.

Therefore:

Claim Transition $\neq$ Liability State Transition.

Payment Trigger

Payment may trigger State Transition evaluation.

Payment does not itself establish Resolution, Discharge, or another Liability State.

Therefore:

Payment Event $\neq$ Liability State Transition by default.

Settlement Trigger

Settlement activity may trigger State Transition evaluation where relevant.

Therefore:

Settlement Event $\neq$ Liability State Transition by default.

Insurance Trigger

Insurance activation, denial, payment, or coverage change may become relevant to Liability State governance.

It does not automatically transition the underlying Liability.

Therefore:

Insurance State Change $\neq$ Liability State Transition.

Temporal Trigger

A Liability State may require transition evaluation after:

a deadline, expiry, defined duration, review period, scheduled activation, or another temporal condition.

Time itself changes Liability State only where the governed structure gives it that effect.

Condition Trigger

A Liability Condition becoming:

satisfied, unsatisfied, failed, expired, or otherwise changed may trigger transition evaluation.

The Condition change and the Liability transition remain separate governance objects.

Dependency Trigger

A State Transition may depend upon another governed state.

Where the dependency changes, LSTTM should determine whether the transition becomes eligible.

Authority Trigger

An authoritative action may trigger or establish a transition where the applicable governance structure gives that authority such effect.

Authority should remain explicit.

Information Trigger

New information may trigger State Transition evaluation.

However:

New Information $\neq$ New Liability State by default.

The information must be assessed within the applicable governance structure.

Transition Eligibility

Before a transition occurs, LSTTM should determine whether the Source State is eligible for the proposed transition.

Not every state may transition directly to every other state.

Permitted Transition

A Permitted Transition is a state movement allowed by the applicable governed structure.

The permission should be methodologically identifiable.

Prohibited Transition

A Prohibited Transition is a state movement that is not permitted under the applicable governed structure.

A system should not perform the transition merely because the target state is technically representable.

Therefore:

Technically Possible State Change $\neq$ Governed Permitted Transition.

Conditional Transition

A transition may be permitted only when defined conditions are satisfied.

Until those conditions are satisfied, the transition should remain conditional.

Therefore:

Eligible Conditional Transition $\neq$ Completed Transition.

Pending Transition

A transition may remain Pending while required:

information, authority, condition, dependency, or process remains incomplete.

Unknown Transition Eligibility

Where available governed information cannot establish whether a transition is permitted, eligibility should remain Unknown.

Therefore:

Unknown Transition Eligibility $\neq$ Permission to Transition.

Uncertain Transition Eligibility

Where transition eligibility remains materially uncertain, the uncertainty should be preserved.

Therefore:

Transition Uncertainty $\neq$ Transition Authorization.

Disputed Transition

Where materially competing governed positions exist concerning whether a transition should occur, the dispute should remain explicit.

Therefore:

Disputed Transition $\neq$ Completed Transition.

Transition Conditions

LSTTM should identify the conditions that must exist before a transition becomes legitimate.

These may include:

state prerequisites, temporal prerequisites, authority requirements, dependency states, Scope conditions, Allocation conditions, obligation conditions, or other applicable requirements.

Condition Satisfaction

Where all required transition conditions are satisfied, the transition may proceed subject to any remaining authority or execution requirements.

Condition satisfaction does not itself constitute transition execution.

Partial Condition Satisfaction

Where only some required conditions are satisfied, the transition should not be treated as complete unless the applicable methodology explicitly permits partial transition.

Transition Authority

Where authority is required, LSTTM should identify:

the authority, the authority scope, the applicable transition, the effective time, and any limitations.

Authority Boundary

Authority to govern one Liability State Transition does not automatically establish authority over all Liability states or Relationships.

Therefore:

Transition Authority $\neq$ Universal Liability Authority.

Authority Action and Transition Effect

An authority may issue an action before the transition becomes operative.

Therefore:

Authority Decision Time $\neq$ Transition Effective Time by default.

Transition Effective Time

Every completed material State Transition should have an identifiable effective time or period where applicable.

This determines when the Target State becomes operative.

Transition Recording Time

The time a transition is recorded may differ from its effective time.

Therefore:

Transition Recording Time $\neq$ Transition Effective Time by default.

Prospective Transition

A transition may be authorized now but become effective later.

Until the effective point is reached, the Source State may remain operative.

Therefore:

Authorized Future Transition $\neq$ Current Target State.

Retrospective Transition

A later governance process may establish that a different state applied during an earlier period.

The system should preserve both:

the state previously represented, and:

the later retrospective transition determination.

Therefore:

Retrospective Transition $\neq$ Historical Erasure.

Immediate Transition

Where the transition conditions and effective time coincide, the Target State may become operative immediately.

Immediate does not mean ungoverned.

Partial Transition

A transition may affect only part of the Liability structure.

Therefore:

Partial State Transition $\neq$ Complete Liability Transition.

The unaffected components should retain their existing states.

Subject-Specific Transition

A transition affecting Subject A should not automatically change Subject B's Liability State.

Therefore:

Subject A Transition $\neq$ Subject B Transition by default.

Relationship-Specific Transition

A transition within one Liability Relationship should not automatically propagate to another Relationship.

Therefore:

Relationship A Transition $\neq$ Relationship B Transition by default.

Scope-Specific Transition

A transition may apply only to one Scope portion.

The remaining Scope should preserve its applicable states.

Allocation-Specific Transition

A transition may apply only to one allocated Liability portion.

Therefore:

Allocation Portion Transition $\neq$ Complete Allocation Transition by default.

Obligation-Specific Transition

Different Liability obligations may transition independently.

One obligation becoming Inactive does not automatically make the complete Liability inactive.

Multi-State Transition

A complex Liability structure may require several component transitions.

Each materially distinct transition should remain identifiable.

Direct Transition

A Direct Transition moves from one state directly to another where the applicable structure permits it.

Sequential Transition

Some Liability states may require intermediate states.

Where sequence is required, those intermediate states should not be bypassed without legitimate governance authority.

Transition Chain

A sequence of State Transitions may form a Transition Chain:

State A $\rightarrow$ State B $\rightarrow$ State C $\rightarrow$ State D Each transition should remain individually reconstructable.

Transition Chain Integrity

A later state should remain traceable through the transition chain to the earlier states from which it developed.

Therefore:

Current State $\neq$ Complete Transition History.

Transition Dependency

A transition may depend upon another transition.

The dependency should remain explicit.

Parallel Transitions

Different Liability components may transition in parallel.

Parallel timing does not mean the transitions share the same governance basis.

Transition Propagation

A completed transition may create legitimate effects elsewhere in the Liability structure.

Propagation should not be assumed.

Therefore:

State Transition $\neq$ Universal Transition Propagation.

Propagation Assessment

Where propagation is possible, LSTTM should identify:

the originating transition, the potentially affected component, the propagation basis, the affected state, and whether separate transition governance is required.

Liability Network Transition

A Liability Network may contain several Relationships undergoing different transitions.

Therefore:

Local State Transition $\neq$ Liability Network Transition by default.

Network Transition Integrity

Network-level transition governance should preserve the identity and state history of constituent Liability Relationships.

A network state should not erase local state differences.

Transition Conflict

A Transition Conflict exists where incompatible transitions are proposed, recorded, or authorized for the same Liability component and applicable period.

The conflict should remain explicit.

Concurrent Transition Conflict

Two transitions may appear to become effective simultaneously.

Where they are incompatible, the applicable priority or authority structure should be determined rather than silently selecting one.

Transition Priority

Where one transition legitimately takes priority, the governing basis should remain explicit.

Therefore:

Latest Transition $\neq$ Governing Transition by default.

Transition Supersession

A transition may later be superseded by another governed transition.

Supersession does not erase the earlier transition.

Therefore:

Transition Supersession $\neq$ Transition Deletion.

Failed Transition

A proposed transition may fail because required conditions, authority, information, or dependencies are absent.

A Failed Transition should remain distinguishable from a transition that never existed.

Cancelled Transition

A pending or future transition may be cancelled where the applicable governance structure permits it.

Cancellation should preserve the transition record.

Therefore:

Transition Cancellation ≠ Transition Erasure.

Reversed Transition

A later governed process may reverse the effect of an earlier transition.

The earlier transition should remain part of history.

Therefore:

Transition Reversal ≠ Historical Deletion.

Transition Correction

Where a transition was incorrectly represented, it may require correction.

The correction should preserve the prior record and explain the corrected state.

Therefore:

Transition Correction ≠ Historical Erasure.

Transition Reassessment

A valid earlier transition may require reassessment because governed circumstances changed.

Therefore:

Transition Reassessment ≠ Transition Correction.

Transition Rationale

Every material State Transition should possess a reconstructable rationale.

A transition record should not consist solely of:

old state, new state.

Therefore:

State Change Record ≠ Transition Rationale.

Transition Provenance

LSTTM should preserve sufficient provenance to establish:

Source State, trigger, conditions, inputs, authority, effective time, Target State, and resulting state record.

Transition Traceability

A qualified reviewer should be able to reconstruct:

Governed Liability State → Trigger → Eligibility → Conditions → Authority → Transition → Resulting State without reconstructing the entire Liability lifecycle from raw data.

Transition Explainability

A transition should be explainable in terms of:

what changed, why transition was permitted, what conditions were satisfied, who or what possessed authority, when the new state became effective, and which Liability component changed.

Transition Sufficiency

A State Transition is sufficiently governed when:

the Source State is explicit, the Transition Object is explicit, the trigger is known, eligibility is established, conditions are represented, authority is identified where required, effective time is known, Target State is explicit, and history remains reconstructable.

Transition Completeness

Transition governance is complete when every materially affected Liability component has either: a completed transition, an explicitly unchanged state, or an explicit unresolved transition state.

Therefore:

Transition Completeness $\neq$ Universal Liability State Change.

Unchanged State

Transition evaluation may determine that no State Transition should occur.

The unchanged state should remain legitimate where the trigger did not satisfy transition requirements.

Therefore:

Transition Evaluation $\neq$ Required Transition.

No Determination Rewrite

LSTTM must not use a State Transition to rewrite whether Liability initially attached.

Therefore:

State Transition $\neq$ Liability Determination.

Where Attachment is materially affected, governance should return to LDS.

No Scope Rewrite

LSTTM must not expand or contract Liability Scope through a State Transition.

Therefore:

State Transition $\neq$ Scope Modification.

Where Scope must change, governance should return to LSAS.

No Allocation Rewrite

LSTTM must not redistribute Liability through state transition.

Therefore:

State Transition $\neq$ Liability Reallocation.

Where Allocation must change, governance should return to LSAS.

No Resolution Shortcut

A transition into an apparently inactive or satisfied state does not automatically establish Liability Resolution or Discharge.

Therefore:

State Transition $\neq$ Liability Resolution.

Resolution belongs to LRDS.

No Finality Shortcut

No State Transition under LSTTM independently establishes Liability Finality.

Therefore:

Terminal-Looking State $\neq$ Liability Finality.

Finality belongs to LCFS.

No Transfer Shortcut

A State Transition may trigger Transfer or Recourse governance.

It does not itself perform Transfer or Recourse.

Therefore:

State Transition $\neq$ Liability Transfer.

Automated Transition Governance

AI or automated systems may support:

trigger detection, eligibility assessment, condition monitoring, transition execution where authorized, and state updating.

Automation should preserve methodology, authority, inputs, timing, and history.

Therefore:

Automated State Transition $\neq$ Authoritative Transition by default.

Transition Monitoring

Systems may monitor conditions relevant to potential State Transitions.

Monitoring should distinguish:

observed change, trigger, eligible transition, and completed transition.

Re-Entry to State Identification

Where transition governance reveals that the Source State was incorrectly identified, the matter should return to LSTIM.

LSTTM should not repair Source State identification by inventing a transition.

Re-Entry to Scope & Allocation

Where transition evaluation reveals a material Scope or Allocation issue, governance should return to LSAS.

Re-Entry to Liability Determination

Where the issue concerns whether Liability still rests on a valid underlying Determination structure, the matter should return to LDS where appropriate.

Earlier Lifecycle Re-Entry

Where a transition issue originates earlier in LIGA™, governance should return to the earliest materially affected governance space.

The canonical principle is:

Re-enter the earliest materially affected governance space.

Historical Integrity

Completed, failed, cancelled, corrected, reversed, superseded, and unresolved transitions should remain reconstructable where materially relevant.

Therefore:

Current Liability State $\neq$ Complete Liability Transition History.

Governed Liability State Transition

The principal output of LSTTM is:

Governed Liability State Transition

It should identify, where applicable:

Transition Identity, Transition Object, Source State, Target State, Transition Trigger, Trigger Source, Transition Eligibility, Transition Conditions, Transition Authority, Transition Effective Time, Transition Recording Time, affected

Subject, affected Relationship, affected Scope, affected Allocation, affected obligation, transition dependencies, propagation effects, uncertainty, conflict, rationale, provenance, and historical relationship.

Meaning of the Output

A Governed Liability State Transition means that movement from one Liability State toward another has been sufficiently governed and represented.

It does not mean that the broader cause or consequence of the change has been fully assessed across the Liability lifecycle.

Therefore:

Governed State Transition $\neq$ Complete Liability Change Assessment.

Handoff to Liability Change Identification

LSTTM hands the:

Governed Liability State Transition

together with its Source State, Target State, trigger, and affected Liability structure to:

LCHIM — Liability Change Identification Module

The next governance question becomes:

What materially changed in the Liability structure, and which governed Liability components are affected by that change?

The boundary is explicit:

LSTIM identifies the current Liability State.

LSTTM governs transition between states.

LCHIM identifies the material Liability Change represented by or surrounding that transition.

Minimum Implementation Framework

A conforming implementation of LSTTM must provide exactly the following eight capabilities:

Transition Object, Source State & Target State Governance

Capability to identify the Liability component undergoing transition, its Governed Source State, the potential or established Target State, and their lifecycle associations.

Transition Trigger & Eligibility Governance

Capability to identify transition triggers and determine whether a proposed transition is permitted, prohibited, conditional, pending, unknown, uncertain, or disputed under the applicable governed structure.

Transition Condition, Dependency & Authority Governance

Capability to identify transition prerequisites, conditions, dependencies, authority requirements, authority boundaries, and their satisfaction states.

Temporal, Partial & Multi-Dimensional Transition Governance

Capability to govern effective time, recording time, prospective and retrospective transitions, partial transitions, and Subject-, Relationship-, Scope-, Allocation-, obligation-, and time-specific transitions.

Sequential, Parallel, Network & Propagation Governance

Capability to preserve Transition Chains, parallel transitions, transition dependencies, local and network transitions, and legitimate propagation without assuming universal state effects.

Failed, Cancelled, Reversed, Superseded, Uncertain & Conflicting Transition

Governance

Capability to represent transitions that do not complete normally while preserving their status, authority, rationale, and historical significance.

Transition Integrity, Traceability, Correction, Reassessment & Re-Entry

Capability to preserve rationale, provenance, history, corrections, reassessments, and targeted re-entry without rewriting Liability Determination, Scope, Allocation, or prior states.

Liability Change Identification Handoff Governance

Capability to produce a Governed Liability State Transition sufficiently explicit, bounded, temporally situated, traceable, and historically preserved for Liability Change Identification.

Governance Logic

The canonical LSTTM governance logic is:

Governed Liability State

↓

Identify Transition Object

↓

Identify Source State

↓

Identify Trigger

↓

Assess Transition Eligibility

↓

Identify Transition Conditions & Dependencies

↓ Identify Authority where required ↓

Determine Target State

↓

Determine Effective Time

↓

Execute / Record Transition

↓

Assess Partial / Network / Propagation Effects

↓

Preserve Uncertainty / Conflict / Failure States

↓

Preserve Rationale / Provenance / History

↓

Governed Liability State Transition

Handoff to Liability Change Identification

Governance Outputs

LSTTM may produce:

Transition Identity

Transition Object

Source Liability State

Target Liability State

Transition Trigger Record

Trigger Source Record

Transition Eligibility State

Permitted Transition State

Prohibited Transition State

Conditional Transition State

Pending Transition State

Unknown Transition Eligibility

Uncertain Transition State

Disputed Transition State

Transition Condition Record

Transition Dependency Record

Transition Authority Record

Transition Effective Time

Transition Recording Time

Prospective Transition Record

Retrospective Transition Record

Partial Transition Record

Subject-Specific Transition

Relationship-Specific Transition

Scope-Specific Transition

Allocation-Specific Transition

Obligation-Specific Transition

Transition Chain

Transition Propagation Record

Network Transition Record

Transition Conflict Record

Failed Transition Record

Cancelled Transition Record

Reversed Transition Record

Superseded Transition Record

Transition Rationale

Transition Provenance Record

The principal output is:

Governed Liability State Transition

Critical Distinctions

LSTTM preserves the following distinctions:

Transition Trigger ≠ Liability State Transition State Transition without Source State ≠ Fully Governed Transition
External Event ≠ Liability State Transition Operational Change ≠ Liability State Transition by default Harm State
Transition ≠ Liability State Transition Claim Transition ≠ Liability State Transition Payment Event ≠ Liability State
Transition by default Settlement Event ≠ Liability State Transition by default Insurance State Change ≠ Liability State
Transition New Information ≠ New Liability State by default Technically Possible State Change ≠ Governed Permitted
Transition Eligible Conditional Transition ≠ Completed Transition Unknown Transition Eligibility ≠ Permission to
Transition Transition Uncertainty ≠ Transition Authorization Disputed Transition ≠ Completed Transition Transition
Authority ≠ Universal Liability Authority Authority Decision Time ≠ Transition Effective Time by default Transition
Recording Time ≠ Transition Effective Time by default Authorized Future Transition ≠ Current Target State
Retrospective Transition ≠ Historical Erasure Partial State Transition ≠ Complete Liability Transition Subject A
Transition ≠ Subject B Transition by default Relationship A Transition ≠ Relationship B Transition by default Allocation
Portion Transition ≠ Complete Allocation Transition by default Current State ≠ Complete Transition History State
Transition ≠ Universal Transition Propagation Local State Transition ≠ Liability Network Transition by default Latest
Transition ≠ Governing Transition by default Transition Supersession ≠ Transition Deletion Transition Cancellation ≠
Transition Erasure Transition Reversal ≠ Historical Deletion Transition Correction ≠ Historical Erasure Transition
Reassessment ≠ Transition Correction State Change Record ≠ Transition Rationale Transition Completeness ≠
Universal Liability State Change Transition Evaluation ≠ Required Transition State Transition ≠ Liability Determination
State Transition ≠ Scope Modification State Transition ≠ Liability Reallocation State Transition ≠ Liability Resolution
Terminal-Looking State ≠ Liability Finality State Transition ≠ Liability Transfer Automated State Transition ≠
Authoritative Transition by default Current Liability State ≠ Complete Liability Transition History Governed State
Transition ≠ Complete Liability Change Assessment

Cross-Architecture Boundary

LSTTM may use governed inputs from other OOF® architectures where those inputs legitimately trigger or inform Liability State Transition governance.

HAGA™ may provide Harm State changes.

ORA™ may provide Operational Reality changes.

AGA™ may provide Responsibility, Accountability, or Authority changes.

ADIT® may provide evidence relevant to transition conditions.

VALIDOS™ may validate transition inputs or processes.

OBIDENTITY® may provide identity, authority, provenance, transfer, or continuity states.

AIG® and ASGA™ may provide AI or autonomous-system operational changes.

VFM® may provide Value Flow changes.

PGA™ may provide Prediction changes.

SIMULOS® may provide simulated transition scenarios.

These external changes do not become Liability State Transitions by themselves.

The canonical interoperability principle is:

An external governed change may trigger or inform Liability State Transition governance without becoming the Liability State Transition and without transferring governance ownership of its original domain to LIGA™.

Canonical Boundary

LSTTM begins with a:

Governed Liability State

and governs legitimate movement from that state toward another Liability State.

LSTTM governs:

Transition Object, Source State, Target State, Transition Trigger, Transition Eligibility, Transition Conditions, Transition Dependencies, Transition Authority, Transition Timing, Partial Transitions, Subject-specific Transitions, Relationship-specific Transitions, Scope-specific Transitions, Allocation-specific Transitions, Obligation-specific Transitions, Transition Chains, Parallel Transitions, Transition Propagation, Network Transitions, Transition Conflicts, Failed Transitions, Cancelled Transitions, Reversed Transitions, Superseded Transitions, Transition Rationale, Transition Provenance, Transition Traceability, Transition Correction, Transition Reassessment, Historical Integrity, and Change Identification handoff.

LSTTM does not govern:

initial Liability Determination, Scope establishment, Allocation distribution, full Liability Change Identification, full Liability Change Assessment, Transfer, Recourse, Resolution, Discharge, or Finality.

LSTTM ends when a:

Governed Liability State Transition

is sufficiently explicit and traceable for Liability Change Identification.

Use Case 1 — Industrial Liability State Transition

An established Liability obligation is currently Conditional because a defined operational dependency has not yet been satisfied.

The dependency is later satisfied.

LSTTM identifies the dependency change as a Transition Trigger, confirms that the Conditional state is eligible to transition, verifies the applicable conditions and authority, and establishes the effective time at which the obligation becomes Active.

Other Liability portions remain unchanged.

The transition is preserved as:

Conditional → Active with its trigger, conditions, effective time, rationale, and Source State history intact.

Use Case 2 — Autonomous System Liability Transition

An autonomous system deployment contains an Active Liability Relationship.

The system is later deactivated.

LSTTM does not automatically transition the Liability to Inactive.

System deactivation is treated only as an operational Transition Trigger.

The module evaluates whether the existing Liability State is eligible to change under the governed Liability structure.

If the relevant Liability obligations continue after system deactivation, the Active state remains operative.

The result preserves the distinction:

Operational Termination $\neq$ Liability Termination.

Canonical Closing Statement

A Liability State should never change merely because an event occurred, a record changed, a payment was made, or an operational system stopped.

A legitimate transition requires a governed Source State, trigger, eligibility, conditions, authority where required, effective time, and resulting state.

The transition must change what is legitimately affected while preserving what remains valid.

And every state that came before must remain reconstructable.

A trigger creates a reason to evaluate transition. It does not create the transition itself.

Govern the transition before declaring the new Liability State.
