

LTFIM — Liability Transfer Identification Module

LTFIM — Liability Transfer Identification Module

Architecture: LIGA™ — Liability Governance Architecture
Parent Standard: Liability Transfer & Recourse Standard (LTRS)
Category: Governance & Enforcement
Subcategory: Liability Governance
Type: Core Module
Governed Space: Liability Transfer Identification
Module ID: LIGA-LTRS-LTFIM-001
Origin ID: OOF.CM.LIGA.10.01.01
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 24 September 2026
Compatibility: OOF® Methodology OS™ · Modular OOF® Architecture Ecosystem
AI-Readable: Yes
Authority: OOF® — OriginOpen® Foundation
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL™)

Canonical Definition

The Liability Transfer Identification Module (LTFIM) governs how a potential movement of established Liability or a Liability-related structure is identified, classified, bounded, associated with its primary Liability origin, and distinguished from movement of economic burden, payment, performance, obligation, recovery rights, or other related interests.

LTFIM determines whether a Liability-relevant movement constitutes a potential Liability Transfer, what Transfer Object is involved, who the relevant Transferor and Transferee are, what basis may support the Transfer, what portion may move, when the movement may become effective, and what part of the original Liability structure remains unchanged.

LTFIM does not assume that every payment, delegation, insurance performance, indemnification, succession event, contractual arrangement, or economic shift constitutes Liability Transfer.

It does not itself execute or validate a Transfer.

It identifies and structures the potential Transfer for subsequent LTRS governance.

It governs the transition:

Governed Liability State & Change Structure → Transfer-Relevant Event → Transfer Object Identification → Transferor & Transferee Identification → Transfer Basis Identification → Transfer Boundary → Transfer Classification → Identified Liability Transfer Structure Its foundational distinction is:

Transfer of Liability ≠ Transfer of Economic Burden ≠ Transfer of Performance ≠ Transfer of Payment Responsibility ≠ Transfer of Recovery Right.

Operational Role

The operational role of LTFIM is:

to determine whether a Liability-relevant movement represents a potential Transfer, what exactly is moving, from whom, to whom, under what basis, and what primary Liability structure must remain preserved.

The module prevents operational or economic movement from being mistaken automatically for substantive Liability Transfer.

Position in the LTRS Internal Flow

The internal LTRS progression is:

Liability Transfer Identification → Liability Sharing → Liability Recourse Identification → Liability Recourse Network → Liability Transfer Continuity LTFIM governs:

Liability Transfer Identification

Its principal input is:

Governed Liability State & Change Structure

Its principal output is:

Identified Liability Transfer Structure

Its handoff is to subsequent LTRS governance, including:

LSHRM — Liability Sharing Module

where Sharing is relevant, and later Recourse and Continuity governance where applicable.

Central Operational Question

Has a Liability-relevant Transfer occurred or become possible, what exactly is being transferred, between which Subjects, under what basis, and what part of the primary Liability structure remains unchanged?

Transfer-Relevant Event

LTFIM begins when an event, arrangement, decision, relationship, or state creates a legitimate reason to examine whether a Liability-related structure has moved or may move.

A Transfer-Relevant Event may include:

assignment, succession, delegation, indemnification, insurance performance, payment, contractual restructuring, organizational change, statutory mechanism, contribution arrangement, or another relevant event.

A Transfer-Relevant Event does not establish Transfer.

Therefore:

Transfer-Relevant Event $\neq$ Liability Transfer.

Primary Liability Origin

Every potential Transfer should remain associated with the primary Liability structure from which it arises.

The primary structure may include:

Liability Determination, Subjects, Relationships, Scope, Allocation, State, obligations, and historical continuity.

Therefore:

Transfer Identification without Primary Liability Association $\neq$ Fully Governed Transfer Identification.

Transfer Object

The first substantive task of LTFIM is to identify exactly what is moving or proposed to move.

Possible Transfer Objects include:

substantive Liability, a Liability-related obligation, performance responsibility, economic burden, payment responsibility, a Recovery Right, a Recourse Right, or another explicitly governed Liability-related interest.

Transfer Object Identity

Each Transfer Object should possess sufficient identity to distinguish it from:

the primary Liability itself, another obligation, another payment, another economic burden, another Recovery Right, and another Transfer.

Substantive Liability Transfer

A potential substantive Liability Transfer concerns movement of the Liability-bearing position itself where such movement is recognized by the applicable governance structure.

This must be distinguished from all other forms of movement.

Obligation Transfer

A Liability-related obligation may move without the entire underlying Liability transferring.

Therefore:

Obligation Transfer $\neq$ Complete Liability Transfer by default.

Performance Transfer

One Subject may undertake performance associated with another Subject's Liability.

Performance movement alone does not establish substantive Liability Transfer.

Therefore:

Performance Transfer $\neq$ Liability Transfer by default.

Economic Burden Transfer

A Liability-related economic burden may move between Subjects through payment, reimbursement, insurance, indemnification, or another mechanism.

Therefore:

Economic Burden Transfer $\neq$ Liability Transfer by default.

Payment Responsibility Transfer

Responsibility for making payment may move without changing who substantively bears Liability.

Therefore:

Payment Responsibility Transfer $\neq$ Liability Transfer by default.

Recovery Right Transfer

A Recovery Right may move independently of the primary Liability.

Therefore:

Recovery Right Transfer $\neq$ Primary Liability Transfer.

Recourse Right Transfer

A Recourse Right may itself be transferred where the applicable structure permits.

This does not transfer the primary Liability from which Recourse originated.

Therefore:

Recourse Right Transfer $\neq$ Primary Liability Transfer.

Transfer Object Classification

Every potential Transfer should be classified according to the actual object moving.

A system should not use a generic "Transferred" state where the Transfer Object remains undefined.

Therefore:

Transfer Label without Transfer Object $\neq$ Sufficient Transfer Identification.

Transferor Identification

LTFIM should identify the Subject from whom the Transfer Object moves or is proposed to move.

The Transferor should remain associated with the pre-Transfer Liability structure.

Transferee Identification

LTFIM should identify the Subject to whom the Transfer Object moves or is proposed to move.

The Transferee should remain distinguishable from:

the original liable Subject, the paying party, the performing party, the insurer, the indemnifier, or another secondary Subject where these roles differ.

Multi-Role Subjects

One Subject may occupy several roles simultaneously.

For example, a Transferee may also become:

a paying party, performing party, successor, indemnifier, or Recourse Subject.

Those roles should remain separately identifiable.

Transferor ≠ Paying Party

The Subject from whom a Transfer Object moves is not necessarily the Subject that previously made payment.

Therefore:

Transferor ≠ Paying Party by default.

Transferee ≠ Liability-Bearing Party by Default

Receiving an obligation, economic burden, payment responsibility, or another Transfer Object does not automatically make the Transferee the substantive Liability-bearing party.

Therefore:

Transferee ≠ Liability-Bearing Party by default.

Transfer Basis

Every potential Transfer should possess an identifiable Transfer Basis.

Possible bases may include:

agreement, law, succession, contractual structure, insurance mechanism, indemnification, institutional mechanism, or another legitimate source.

Transfer Basis Sufficiency

The existence of a Transfer-Relevant Event does not establish that a sufficient Transfer Basis exists.

Therefore:

Transfer Event ≠ Transfer Basis.

Transfer Basis vs Primary Liability Basis

The basis permitting Transfer may differ from the basis establishing primary Liability.

Therefore:

Primary Liability Basis ≠ Transfer Basis by default.

Transfer Authority

Where Transfer requires authority, LTFIM should identify:

the authority, authority source, authority scope, affected Transfer Object, and any material limitations.

Authority Boundary

Authority to transfer one Liability-related structure does not automatically authorize transfer of every Liability component.

Therefore:

Transfer Authority over Object A ≠ Transfer Authority over Object B by default.

Transfer Scope

LTFIM should identify the extent of the proposed or observed Transfer.

The Transfer may be:

complete, partial, conditional, temporary, limited, Subject-specific, Relationship-specific, Scope-specific, Allocation-specific, obligation-specific, or otherwise bounded.

Complete Transfer Candidate

A Complete Transfer candidate concerns the complete identified Transfer Object.

It does not necessarily mean the complete primary Liability transfers.

Partial Transfer Candidate

Where only part of the Transfer Object moves, the transferred and retained portions should both remain explicit.

Therefore:

Partial Transfer $\neq$ Complete Transfer.

Retained Liability Structure

LTFIM should explicitly identify what remains unchanged after the proposed or observed movement.

This is necessary to prevent Transfer from becoming silent Liability replacement.

Transfer Boundary

The Transfer Boundary identifies:

what moves, what does not move, from whom, to whom, under what Basis, and within what Scope.

Transfer and Liability Scope

A Transfer should not silently enlarge the original Liability Scope.

Therefore:

Transfer Scope $\neq$ Primary Liability Scope by default.

Transfer and Liability Allocation

A Transfer may affect how Liability-related burdens are carried without changing the original Allocation.

Therefore:

Transfer $\neq$ Liability Reallocation by default.

Transfer and Liability State

A Transfer may affect the current State of one Liability component while leaving other States unchanged.

Therefore:

Transfer Event $\neq$ Universal Liability State Change.

Transfer and Relationship Identity

A Transfer may modify an existing Relationship or create a secondary Relationship.

LTFIM should identify which structure applies.

Therefore:

Transfer $\neq$ New Liability Relationship by default.

Secondary Relationship Candidate

Where the movement creates a new relationship between Subjects, LTFIM should identify a Secondary Liability Relationship candidate.

The candidate should remain linked to primary Liability.

Transfer vs Sharing

Transfer and Sharing are distinct.

Transfer concerns movement of a defined Transfer Object.

Sharing concerns distribution or participation across multiple Subjects.

Therefore:

Liability Transfer $\neq$ Liability Sharing.

Where Sharing is identified, the matter should proceed to LSHRM.

Transfer vs Recourse

Transfer and Recourse are also distinct.

A Transfer moves a governed object.

Recourse creates or governs a secondary recovery relationship.

Therefore:

Liability Transfer $\neq$ Liability Recourse.

Transfer vs Succession

Succession may create a Transfer structure, but not every Transfer is succession.

LTFIM should identify succession explicitly where applicable.

Succession Candidate

Where organizational, legal, estate, or another legitimate succession event may move a Liability-related structure, LTFIM should identify:

Predecessor, Successor, succession basis, potential Transfer Object, effective time, and retained structure.

Succession Continuity

A succession event should not automatically create a new Liability Origin.

Therefore:

Succession $\neq$ New Liability Origin by default.

Transfer vs Indemnification

Indemnification may move economic burden or reimbursement responsibility without transferring primary Liability.

Therefore:

Indemnification $\neq$ Liability Transfer by default.

Transfer vs Insurance Performance

Insurance performance may move economic burden.

It does not automatically transfer substantive Liability.

Therefore:

Insurance Performance $\neq$ Liability Transfer by default.

Transfer vs Payment

Payment is movement of value.

Liability Transfer concerns movement of a governed Liability-related position or object.

Therefore:

Payment $\neq$ Liability Transfer.

Transfer vs Delegation

Operational or contractual delegation may transfer performance responsibility without transferring Liability.

Therefore:

Delegation $\neq$ Liability Transfer by default.

Transfer vs Responsibility Transfer

A Responsibility structure may move under AGA™ or another applicable governance mechanism.

That does not automatically transfer Liability.

Therefore:

Responsibility Transfer $\neq$ Liability Transfer.

Transfer vs Value Transfer

Value may move under VFM® without Liability moving.

Therefore:

Value Transfer $\neq$ Liability Transfer.

Transfer vs Identity Transfer

Identity, ownership, authority, or provenance changes under OBIDENTITY® may become Transfer-relevant inputs.

They do not automatically constitute Liability Transfer.

Therefore:

Identity Transfer $\neq$ Liability Transfer.

Transfer Trigger

A Transfer Trigger is an event or condition creating a reason to assess whether a Transfer exists or may occur.

Possible triggers include:

payment, succession, agreement, authority action, insurance activation, indemnification, organizational restructuring, or another governed event.

Trigger vs Transfer

The trigger and Transfer remain distinct.

Therefore:

Transfer Trigger $\neq$ Completed Transfer.

Transfer Status

LTFIM may identify the potential Transfer as:

Proposed, Pending, Conditional, Observed, Unknown, Uncertain, Disputed, or another explicitly governed identification state.

These are Transfer identification states, not universal legal classifications.

Proposed Transfer

A proposed Transfer has been identified but has not yet become operative.

Therefore:

Proposed Transfer ≠ Completed Transfer.

Pending Transfer

A Transfer may remain Pending while required information, authority, conditions, or other dependencies remain unresolved.

Conditional Transfer

A potential Transfer may depend upon explicit conditions.

Therefore:

Conditional Transfer ≠ Effective Transfer.

Unknown Transfer

Where available information cannot establish whether a Transfer occurred, the Transfer state should remain Unknown.

Therefore:

Unknown Transfer ≠ No Transfer.

Uncertain Transfer

Where several materially plausible Transfer interpretations remain, uncertainty should remain explicit.

Therefore:

Uncertain Transfer ≠ Authority to Select a Preferred Transfer.

Disputed Transfer

Where materially competing governed positions exist concerning whether a Transfer occurred, what moved, or to whom, the dispute should remain represented.

Therefore:

Disputed Transfer ≠ Completed Transfer.

Transfer Effective Time

Where identifiable, LTFIM should distinguish the time at which the Transfer becomes operative.

Transfer Event Time

The event associated with a potential Transfer may occur before or after the Transfer becomes effective.

Therefore:

Transfer Event Time ≠ Transfer Effective Time by default.

Transfer Decision Time

A Transfer may be decided or authorized before its effective time.

Therefore:

Transfer Decision Time ≠ Transfer Effective Time by default.

Transfer Recording Time

The time a Transfer is entered into a system may differ from its effective time.

Therefore:

Transfer Recording Time ≠ Transfer Effective Time by default.

Prospective Transfer

A Transfer may be known in advance but not yet operative.

Therefore:

Known Future Transfer $\neq$ Current Transfer.

Retrospectively Identified Transfer

A Transfer may become known only after it became effective.

LTFIM should preserve both discovery and effective time.

Therefore:

Transfer Discovery Time $\neq$ Transfer Effective Time by default.

Transfer Dependency

A Transfer may depend upon:

authority, condition satisfaction, payment, succession, another Transfer, another Relationship, or another governed state.

Material dependencies should remain explicit.

Multi-Subject Transfer

A Transfer may involve more than one Transferor or Transferee.

Each material Subject role should remain explicit.

Multi-Object Transfer

One event may involve several different Transfer Objects.

Each should be classified separately.

For example, the same arrangement may transfer performance responsibility but only partially transfer economic burden.

Therefore:

One Transfer Event $\neq$ One Transfer Object by default.

Transfer Chain Candidate

A Transfer Object may move through several Subjects.

LTFIM should identify where a Transfer Chain may exist.

Example:

Subject A $\rightarrow$ Subject B $\rightarrow$ Subject C Each movement should remain distinguishable.

Transfer Chain vs Single Transfer

A chain of Transfers should not be represented as one Transfer where the individual movements possess different Bases, Subjects, times, or Scopes.

Transfer Network Candidate

Multiple Transfer Relationships may form a wider Liability Network.

LTFIM should identify potential network relevance without collapsing distinct Transfers.

Transfer Conflict

Different sources may indicate incompatible Transfer structures.

The conflict should remain explicit.

Therefore:

Conflicting Transfer Records $\neq$ One Governed Transfer by default.

Duplicate Transfer Record

Multiple records may refer to the same Transfer.

Duplicate records should not create multiple Transfers.

Therefore:

Multiple Transfer Records $\neq$ Multiple Transfers by default.

Transfer Evidence Association

Evidence may support identification of:

Transfer Object, Transferor, Transferee, Basis, Scope, authority, conditions, or effective time.

Evidence does not itself constitute Transfer.

Therefore:

Evidence of Transfer $\neq$ Transfer itself.

Transfer Provenance

LTFIM should preserve sufficient provenance to identify:

the primary Liability, Transfer-Relevant Event, Transfer Object, Transferor, Transferee, Transfer Basis, source, authority where relevant, time, and supporting governed inputs.

Transfer Rationale

The reason why an observed movement is classified as a particular Transfer type should remain reconstructable.

Therefore:

Transfer Classification $\neq$ Transfer Rationale.

Transfer Identification Sufficiency

A potential Transfer is sufficiently identified when a qualified downstream process can determine:

what may have moved, from whom, to whom, under what Basis, within what Scope, at what time, under what conditions, and what primary Liability structure remains preserved.

Transfer Identification Integrity

LTFIM must not use Transfer Identification to:

redetermine primary Liability, expand primary Liability Scope, rewrite original Allocation, erase the original liable Subject, convert payment automatically into Liability, or create Recourse without separate governance.

No Determination Shortcut

Transfer Identification does not establish or alter whether primary Liability attached.

Therefore:

Transfer Identification $\neq$ Liability Determination.

No Scope Shortcut

Transfer Identification does not independently change primary Liability Scope.

Therefore:

Transfer Identification $\neq$ Liability Scope Modification.

No Allocation Shortcut

Transfer Identification does not independently redistribute the original Liability Allocation.

Therefore:

Transfer Identification ≠ Liability Reallocation.

No Recourse Shortcut

Identifying Transfer does not automatically establish a Recourse relationship.

Therefore:

Identified Transfer ≠ Established Recourse.

No Resolution Shortcut

Transfer does not establish Resolution or Discharge.

Therefore:

Identified Transfer ≠ Liability Resolution.

No Finality Shortcut

Transfer does not establish Liability Finality.

Therefore:

Identified Transfer ≠ Liability Finality.

Upstream Re-Entry

Where Transfer Identification reveals a material defect in the primary Liability structure, the matter should return to the earliest materially affected LIGA™ governance space.

The canonical rule is:

Re-enter the earliest materially affected governance space.

Historical Integrity

Transfer Identification should preserve the Liability structure that existed before the potential Transfer.

Therefore:

Transfer Identification ≠ Historical Rewrite.

Origin Continuity

The identified Transfer should remain linked to the existing Liability Origin unless separate governance establishes a genuinely distinct Liability Origin.

Therefore:

Transfer ≠ New Liability Origin by default.

Automated Transfer Identification

AI or automated systems may assist with:

Transfer-Relevant Event detection, Transfer Object classification, Subject identification, Basis association, Scope analysis, timeline analysis, and conflict detection.

Automation should preserve uncertainty, methodology, source, and authority boundaries.

Therefore:

Automated Transfer Identification ≠ Authoritative Liability Transfer by default.

Identified Liability Transfer Structure

The principal output of LTFIM is:

Identified Liability Transfer Structure

It should identify, where applicable:

Primary Liability association, Transfer Identity, Transfer-Relevant Event, Transfer Object, Transfer Object classification, Transferor, Transferee, Transfer Basis, Transfer authority, Transfer Scope, retained Liability structure, Transfer conditions, Transfer dependencies, Transfer status, event time, decision time, effective time, recording time, possible secondary Relationship, possible Sharing relevance, possible Succession relevance, possible Recourse relevance, network relevance, uncertainty, dispute, conflict, rationale, and provenance.

Meaning of the Output

An Identified Liability Transfer Structure means that a potential or observed movement has been sufficiently distinguished and structured for continued Transfer, Sharing, Recourse, and Continuity governance.

It does not mean that substantive Liability has necessarily transferred.

Therefore:

Identified Liability Transfer Structure ≠ Completed Liability Transfer.

Downstream Handoff

The Identified Liability Transfer Structure may proceed according to its characteristics.

Where multiple Subjects share the relevant Liability-related structure, governance proceeds to:

LSHRM — Liability Sharing Module

Where Recourse becomes relevant, subsequent governance proceeds through the applicable Recourse modules.

All Transfer structures ultimately require continuity preservation under LTRS.

Minimum Implementation Framework

A conforming implementation of LTFIM must provide exactly the following eight capabilities:

Primary Liability & Transfer-Relevant Event Identification

Capability to identify the primary Liability structure and the event, arrangement, decision, condition, or relationship creating potential Transfer relevance.

Transfer Object Identification & Classification

Capability to distinguish substantive Liability, obligation, performance responsibility, economic burden, payment responsibility, Recovery Right, Recourse Right, and other Liability-related Transfer Objects.

Transferor, Transferee & Subject-Role Governance

Capability to identify Transferor, Transferee, multi-role Subjects, multiple Transferors or Transferees, and distinguish those roles from liable, paying, performing, insuring, indemnifying, or recovering parties.

Transfer Basis, Authority, Scope & Retained-Structure Governance

Capability to identify Transfer Basis, authority where required, complete or partial Transfer Scope, conditions, and the Liability structure remaining unchanged.

Temporal, Conditional, Dependency & Transfer-State Governance

Capability to distinguish event, decision, effective, discovery, and recording times and govern Proposed, Pending, Conditional, Unknown, Uncertain, and Disputed Transfer states.

Multi-Object, Chain, Network, Duplicate & Conflict Governance

Capability to identify multiple Transfer Objects, Transfer Chains, network relevance, duplicate Transfer records, and conflicting Transfer structures without collapsing distinct movements.

Transfer Integrity, Provenance, Historical Continuity & Re-Entry

Capability to preserve primary Liability, Origin continuity, rationale, provenance, historical structure, and targeted upstream re-entry without silently changing Determination, Scope, Allocation, Resolution, or Finality.

LTRS Downstream Handoff Governance

Capability to produce an Identified Liability Transfer Structure sufficiently explicit, bounded, temporally situated, traceable, and historically connected for Liability Sharing, Recourse, Network, and Transfer Continuity governance.

Governance Logic

The canonical LTFIM governance logic is:

Governed Liability State & Change Structure

↓

Identify Transfer-Relevant Event

↓

Associate Primary Liability

↓

Identify Transfer Object

↓

Classify What Is Actually Moving

↓

Identify Transferor & Transferee

↓

Identify Transfer Basis

↓ Identify Authority where required ↓

Establish Transfer Scope & Boundary

↓

Identify Retained Liability Structure

↓

Establish Conditions & Dependencies

↓

Establish Temporal Structure

↓

Identify Transfer State

↓

Assess Sharing / Succession / Recourse / Network Relevance

↓

Preserve Uncertainty / Dispute / Conflict

↓

Preserve Rationale / Provenance / History

↓

Identified Liability Transfer Structure

Governance Outputs

LTFIM may produce:

Transfer Identity

Primary Liability Association

Transfer-Relevant Event Record

Transfer Object

Transfer Object Classification

Substantive Liability Transfer Candidate

Obligation Transfer Candidate

Performance Transfer Candidate

Economic Burden Transfer Candidate

Payment Responsibility Transfer Candidate

Recovery Right Transfer Candidate

Recourse Right Transfer Candidate

Transferor Record

Transferee Record

Transfer Basis

Transfer Authority Association

Transfer Scope

Retained Liability Structure

Transfer Condition Record

Transfer Dependency Record

Transfer State

Transfer Effective Time

Transfer Chain Candidate

Transfer Network Candidate

Secondary Relationship Candidate

Sharing Relevance Record

Succession Relevance Record

Recourse Relevance Record

Transfer Conflict Record

Transfer Rationale

Transfer Provenance Record

The principal output is:

Identified Liability Transfer Structure

Critical Distinctions

LTFIM preserves the following distinctions:

Transfer of Liability ≠ Transfer of Economic Burden Transfer of Liability ≠ Transfer of Performance Transfer of Liability
≠ Transfer of Payment Responsibility Transfer of Liability ≠ Transfer of Recovery Right Transfer-Relevant Event ≠
Liability Transfer Transfer Identification without Primary Liability Association ≠ Fully Governed Transfer Identification
Obligation Transfer ≠ Complete Liability Transfer by default Performance Transfer ≠ Liability Transfer by default
Economic Burden Transfer ≠ Liability Transfer by default Payment Responsibility Transfer ≠ Liability Transfer by
default Recovery Right Transfer ≠ Primary Liability Transfer Recourse Right Transfer ≠ Primary Liability Transfer
Transfer Label without Transfer Object ≠ Sufficient Transfer Identification Transferor ≠ Paying Party by default
Transferee ≠ Liability-Bearing Party by default Transfer Event ≠ Transfer Basis Primary Liability Basis ≠ Transfer Basis
by default Transfer Authority over Object A ≠ Transfer Authority over Object B by default Partial Transfer ≠ Complete
Transfer Transfer Scope ≠ Primary Liability Scope by default Transfer ≠ Liability Reallocation by default Transfer Event
≠ Universal Liability State Change Transfer ≠ New Liability Relationship by default Liability Transfer ≠ Liability Sharing
Liability Transfer ≠ Liability Recourse Succession ≠ New Liability Origin by default Indemnification ≠ Liability Transfer
by default Insurance Performance ≠ Liability Transfer by default Payment ≠ Liability Transfer Delegation ≠ Liability
Transfer by default Responsibility Transfer ≠ Liability Transfer Value Transfer ≠ Liability Transfer Identity Transfer ≠
Liability Transfer Transfer Trigger ≠ Completed Transfer Proposed Transfer ≠ Completed Transfer Conditional
Transfer ≠ Effective Transfer Unknown Transfer ≠ No Transfer Uncertain Transfer ≠ Authority to Select a Preferred
Transfer Disputed Transfer ≠ Completed Transfer Transfer Event Time ≠ Transfer Effective Time by default Transfer
Decision Time ≠ Transfer Effective Time by default Transfer Recording Time ≠ Transfer Effective Time by default
Known Future Transfer ≠ Current Transfer Transfer Discovery Time ≠ Transfer Effective Time by default One Transfer
Event ≠ One Transfer Object by default Conflicting Transfer Records ≠ One Governed Transfer by default Multiple
Transfer Records ≠ Multiple Transfers by default Evidence of Transfer ≠ Transfer itself Transfer Classification ≠
Transfer Rationale Transfer Identification ≠ Liability Determination Transfer Identification ≠ Liability Scope Modification
Transfer Identification ≠ Liability Reallocation Identified Transfer ≠ Established Recourse Identified Transfer ≠ Liability
Resolution Identified Transfer ≠ Liability Finality Transfer Identification ≠ Historical Rewrite Transfer ≠ New Liability
Origin by default Automated Transfer Identification ≠ Authoritative Liability Transfer by default Identified Liability
Transfer Structure ≠ Completed Liability Transfer

Cross-Architecture Boundary

LTFIM may receive relevant inputs from adjacent OOF® architectures.

ORA™ may establish the operational event associated with a possible Transfer.

AGA™ may establish Responsibility, Accountability, Delegation, or Authority structures.

HAGA™ may provide Harm-related context.

ADIT® may provide evidence of a Transfer-Relevant Event.

VALIDOS™ may validate Transfer-relevant inputs.

OBIDENTITY® may govern Identity, Ownership, Authority, Provenance, Transfer, and Continuity mechanisms within its own domain.

VFM® may govern Value Transfer.

AIG® and ASGA™ may provide AI or autonomous-system operational structures.

These inputs do not automatically establish Liability Transfer.

The canonical interoperability rule is:

An external Transfer mechanism may produce a Liability-relevant input, but LTFIM governs only whether a Liability-related Transfer Object exists and how that potential Transfer is identified within LIGA™.

Canonical Boundary

LTFIM begins when a governed Liability structure encounters a Transfer-Relevant Event or another legitimate reason to examine whether a Liability-related object has moved or may move.

LTFIM governs:

Primary Liability association, Transfer-Relevant Event identification, Transfer Object identification, Transfer classification, Transferor, Transferee, Transfer Basis, Transfer authority, Transfer Scope, retained structure, conditions, dependencies, Transfer states, temporal structure, Transfer Chains, network relevance, duplicate records, conflicts, uncertainty, rationale, provenance, historical integrity, and downstream routing.

LTFIM does not independently govern:

initial Liability Determination, initial Scope & Allocation, full Liability Sharing, full Recourse determination, Recourse Network governance, Resolution, Discharge, or Finality.

LTFIM ends when an:

Identified Liability Transfer Structure

is sufficiently explicit and traceable for continued LTRS governance.

Use Case 1 — Insurance Payment Without Liability Transfer

A manufacturer bears established Liability for a covered loss.

Its insurer makes payment to the affected party.

LTFIM identifies the insurance payment as a Transfer-Relevant Event but distinguishes the object that moved.

Economic value moved from the insurer.

That fact does not establish that the manufacturer's substantive Liability transferred to the insurer.

The module preserves:

the primary Liability, the manufacturer as the original Liability-bearing Subject, the insurer as the paying Subject, the economic movement, and any potential downstream Recourse relevance.

The governing distinction is:

Liability-Bearing Party ≠ Paying Party.

Use Case 2 — Partial Obligation Transfer Through Succession

An organization with an established Liability structure undergoes a legitimate succession event.

Only a defined group of Liability-related obligations moves to the successor, while other obligations remain with the predecessor.

LTFIM identifies:

the Predecessor, Successor, succession basis, transferred obligations, retained obligations, Transfer Scope, and effective time.

It does not classify the event as a complete Liability Transfer merely because succession occurred.

The resulting Identified Liability Transfer Structure preserves both transferred and retained Liability components for subsequent LTRS governance.

Canonical Closing Statement

Before Liability can be transferred, the governance system must know what actually moved.

A payment may move value.

Delegation may move performance.

Insurance may move economic burden.

Succession may move obligations.

A Recovery Right may move independently.

None of these movements should automatically be called Liability Transfer.

LTFIM establishes the Transfer Object, Subjects, Basis, Scope, timing, and relationship to primary Liability before downstream Transfer governance proceeds.

Identify what moved before deciding what the movement means.

A movement becomes a governed Liability Transfer candidate only when its object, origin, parties, basis, and boundary are explicit.
