Software Creation Standard - (SCS) Preview

Software Creation Standard (SCS) Category: Governance & Enforcement Subcategory: Software Lifecycle Governance

The Software Creation Standard (SCS) governs how software is designed, generated, implemented, assembled, and transformed through identifiable, authorized, and evidence-supported creation processes. It establishes the conditions under which software creation activities and resulting artifacts remain aligned with governed requirements, legitimate authority, defined execution boundaries, and reconstructable creation evidence, regardless of whether creation is performed by humans, organizations, AI agents, or autonomous systems.

SCS governs Software Creation Governance.

Software Creation Capability ≠ Software Creation Authority. The ability to generate functional software does not establish the authority to create it. Software creation must remain connected to governed requirements, legitimate execution boundaries, identifiable artifacts, and reconstructable evidence before it can be recognized as a governed lifecycle activity.
