

Value Emergence Event Module (VEEM)

Value Emergence Event Module (VEEM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: VFM® — Value Flow Mechanisms Architecture
Parent Standard: Value Emergence Standard (VES)
Module: VEEM — Value Emergence Event Module
Operational Layer: Value Emergence Event Layer
Category: Governance & Enforcement
Subcategory: Value Lifecycle Governance
Type: Core Module
Governed Space: Value Emergence Event
Origin ID: VFM-VES-VEEM-003.3
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 24 August 2026
Compatibility: OOF® Methodology OS™ · GOA™ · ORA™ · INTEGROS® · CLA™ · ADIT® · VALIDOS® · SIMULOS® · OBIDENITY®
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodology Intellectual Property Protection
Canonical Language: UCL — Universal Canonical Language

Canonical Definition

Value Emergence Event Module (VEEM) is the third Core Module of the Value Emergence Standard (VES) within VFM® — Value Flow Mechanisms Architecture.

VEEM governs the identification, definition, structuring, temporal localization, contextualization, and documentation of the event, occurrence, transition, activation, realization, or materially identifiable change through which threshold-satisfied potential value moves into an emergence event capable of supporting a subsequent Value Emergence Determination.

The Module establishes the governed transition between:

Emergence-Ready Value

and

Value whose emergence has materially occurred and can now be evaluated.

VEEM does not determine conclusively that value exists.

That responsibility belongs to:

VEDM — Value Emergence Determination Module.

VEEM governs what happened at the point of emergence.

VEDM governs whether what happened is sufficient to determine that value has emerged.

Architectural Position

VEEM is the third module within the Value Emergence Standard.

It follows:

VETM — Value Emergence Threshold Module

and precedes:

VEDM — Value Emergence Determination Module.

The internal sequence is:

Emergence Conditions → Emergence Threshold → Emergence Event → Emergence Determination → Emergence Record

VECM establishes:

What conditions must exist?

VETM establishes:

When are those conditions sufficient?

VEEM establishes:

What materially occurred when the emergence boundary was crossed?

VEDM establishes:

Does that occurrence legitimately establish that value emerged?

VERM preserves:

What emergence was ultimately established and on what basis?

Internal Value Flow

Potential Value → Emergence Conditions → Threshold Satisfaction → Threshold Crossing → Emergence-Ready Value → Emergence Event Candidate → Event Identification → Event Context → Event Temporal Position → Event-to-Value Relationship → Event State → Governed Value Emergence Event → Value Emergence Determination

This flow prevents value existence from being declared merely because a threshold was theoretically satisfied.

Something must materially occur that connects the satisfied emergence conditions to the claimed emergence of value.

Governance Flow Position

Within the complete VFM® governance flow:

Value Context → Value Origin → Value Emergence → Value Recognition → Value State → Value Change → Value Development / Value Degradation → Value Nullification → Value Restoration / Value Extinction

Within Value Emergence:

VECM — Value Emergence Conditions → VETM — Value Emergence Threshold → VEEM — Value Emergence Event → VEDM — Value Emergence Determination → VERM — Value Emergence Record

VEEM therefore occupies the exact transition point between:

sufficient conditions for emergence

and

formal determination that value now exists.

Operational Purpose

Value does not necessarily emerge simply because:

money was invested; an asset was created; a product was completed; infrastructure became available; a capability became technically operational; a transaction occurred; a service was launched; a resource was consumed; a project reached completion; a threshold was theoretically satisfied.

These events may be related to value.

They are not automatically Value Emergence Events.

VEEM requires the relevant occurrence to be connected to the specific governed value established through the Value Context Standard.

The Module therefore asks:

What actually happened that may mark the transition from potential value toward existing value?

Value Emergence Event

A Value Emergence Event is a materially identifiable occurrence, transition, activation, realization, interaction, outcome, state change, or other governed event through which threshold-satisfied potential value manifests in a form capable of being evaluated as existent value.

A Value Emergence Event must be connected to:

Governed Value Context

Value Origin Emergence Conditions Emergence Threshold Relevant Occurrence

The event is therefore not an isolated operational event.

It is an event interpreted specifically within the governed value lifecycle.

Operational Event ≠ Value Emergence Event

An operational event may occur without creating value.

For example:

Factory starts production.

That is an operational event.

Whether it constitutes a Value Emergence Event depends upon the governed value.

If the governed value is:

production capability, the event may be highly relevant.

If the governed value is:

reduction of customer delivery time, production startup alone may not yet establish emergence.

If the governed value is:

reduction of manufacturing cost, production startup may even occur before any relevant value has emerged.

Therefore:

Operational Event ≠ Value Emergence Event

unless the event is materially connected to the defined value context.

Transaction ≠ Value Emergence Event

A transaction may transfer money, assets, rights, obligations, or resources.

It does not automatically establish that value has emerged.

For example:

Investor pays CHF 10 million

does not establish:

CHF 10 million of value emerged.

The payment may finance a potential value source.

VEEM separates:

resource movement

from

value emergence.

This distinction is fundamental for banking, investment, public finance, accounting, infrastructure, and economic analysis.

Cost ≠ Value Emergence

Resources consumed in creating potential value must not automatically be interpreted as value created.

Therefore:

Cost Incurred ≠ Value Emerged

Capital Deployed ≠ Value Emerged

Budget Spent ≠ Value Emerged

Asset Completed ≠ Value Emerged

Technology Deployed ≠ Value Emerged

The relevant Value Emergence Event must demonstrate a material connection between the potential value and the occurrence through which that value begins to exist.

Event Identification

VEEM requires the emergence event to be identifiable.

Identification may include:

event identity; event type; event source; event time; event location or environment where relevant; participating entities; affected value object; beneficiary relationship; originating value source; applicable emergence conditions; applicable threshold; resulting observable change; event evidence; uncertainty.

The exact implementation may vary.

The governance requirement remains:

the emergence event must be reconstructable sufficiently to support downstream determination.

Event Types

Value may emerge through different types of events.

VEEM may govern:

Activation Event

A capability becomes materially usable.

Utilization Event

A previously available capability is actually used in a value-producing context.

Delivery Event

A value-bearing outcome reaches the relevant beneficiary.

Performance Event

A capability produces the defined performance associated with the governed value.

Conversion Event

A potential value source produces a materially different value-bearing result.

Interaction Event

Value emerges through interaction between multiple actors, systems, resources, or capabilities.

Availability Event

A resource or capability becomes materially available where availability itself constitutes the governed value.

Outcome Event

The defined outcome associated with the governed value occurs.

Realization Event

Previously potential value becomes materially realized.

Composite Emergence Event

Several events together establish the relevant emergence occurrence.

VFM® does not require all value to emerge through one universal event type.

Single Event vs. Composite Event

Some value may emerge through one identifiable event.

Example:

a service successfully delivered to a beneficiary.

Other value may require a sequence or combination of events.

Example:

technology activation + sustained operation + beneficiary utilization + measurable outcome.

VEEM therefore distinguishes:

Single Emergence Event

from

Composite Emergence Event.

A composite event must preserve the relationship between its constituent occurrences.

Instantaneous vs. Progressive Emergence

Value may emerge:

instantaneously

or

progressively.

An instantaneous emergence event may occur at a specific moment.

A progressive emergence event may develop across:

multiple interactions;

repeated outputs; sustained utilization; cumulative performance; continuous availability; gradual realization.

VEEM must therefore permit an emergence event to have:

Event Start

Event Progression

Event Completion

where the governed value requires it.

Temporal Localization

VEEM establishes the temporal position of the emergence event.

Where possible, the Module should distinguish:

Before Emergence Event

During Emergence Event

After Emergence Event

This enables downstream VFM® governance to identify when value entered existence and subsequently distinguish:

Value Emergence

from

Value Development

or

Value Degradation.

Without temporal localization, later value changes may be incorrectly treated as part of original value creation.

Emergence Event Boundary

VEEM must identify where the emergence event begins and where it ends.

This is especially important for progressive or composite value emergence.

The boundary may be based upon:

activation; first qualifying use; delivery; threshold crossing; outcome occurrence; sustained performance; beneficiary realization; completion of an event sequence; other context-specific conditions.

The event boundary must correspond to the governed value rather than an arbitrary project milestone.

Event-to-Value Relationship

The existence of an event does not establish that the event caused or produced the governed value.

VEEM therefore requires an explicit relationship between:

Emergence Event

and

Governed Value.

The relationship may be:

direct; enabling; contributory; composite; conditional; dependent; uncertain.

This relationship must remain visible for VEDM.

Direct Emergence

Direct emergence occurs where the event itself produces or manifests the governed value with minimal intermediate dependency.

Example:

A transportation service successfully moves the beneficiary from the defined origin to destination.

Where the governed value is:

successful transportation delivery

the completion event may have a direct relationship to value emergence.

Enabling Event

An event may enable value without itself establishing that value has emerged.

Example:

A hospital installs a new diagnostic system.

Installation creates capability.

If the governed value is:

improved diagnostic outcome

installation alone is an enabling event, not necessarily the Value Emergence Event.

This distinction prevents:

Capability Creation

from being silently transformed into:

Value Creation.

Contributory Event

Some events contribute to value emergence without independently establishing it.

Several contributory events may together form a Composite Emergence Event.

VEEM should therefore preserve:

Event A + Event B + Event C $\rightarrow$ Composite Emergence Basis

where appropriate.

Beneficiary Relationship

Where value depends upon a beneficiary, VEEM should preserve the relationship between the emergence event and that beneficiary.

A capability may exist.

An output may exist.

A product may exist.

But where the governed value depends upon beneficiary realization, value may not emerge until the relevant beneficiary relationship becomes operationally meaningful.

This does not mean all value requires a human beneficiary.

The beneficiary may be:

individual; organization; system; ecosystem; infrastructure; public institution; economy; mission; operational process; future capability.

The relevant beneficiary is inherited from the governed Value Context.

Event Materiality

Not every occurrence related to potential value should become a Value Emergence Event.

VEEM therefore requires materiality.

An event is materially relevant where it changes the governed value lifecycle sufficiently to justify progression toward Value Emergence Determination.

Materiality may depend upon:

value purpose; beneficiary; scale; duration; consequence; threshold relationship; operational significance; persistence; context.

Event Evidence

A Value Emergence Event should have an identifiable evidential basis proportionate to its significance.

Evidence may include:

operational records; system outputs; delivery records; utilization data; performance measurements; beneficiary interaction; transaction records; physical observation; sensor data; production data; mission data; financial data;

documented outcomes.

VEEM governs the event relationship.

It does not replace broader evidence governance under ADIT®, integrity governance under INTEGROS®, or validation governance under VALIDOS®.

Event Uncertainty

Not every emergence event will be perfectly observable.

VEEM therefore allows uncertainty concerning:

event timing; event completeness; event causality; event materiality; event-to-value relationship; beneficiary effect; event persistence; composite event completion.

Where material uncertainty exists, it must remain visible when the event proceeds to VEDM.

Event States

VEEM may assign governed event states including:

No Emergence Event

No materially relevant event has been identified.

Event Candidate

A potentially relevant emergence event has been identified.

Event In Progress

A progressive or composite emergence event has begun but is not complete.

Event Occurred

The governed emergence event has materially occurred.

Event Uncertain

The available basis does not support reliable characterization of the event.

Event Failed

The expected emergence event did not complete sufficiently.

Event Reversed

An event occurred but was materially reversed before emergence could be determined.

Event Superseded

A later event replaces the earlier event as the relevant emergence basis.

These states support complex and dynamic value environments.

Failed Emergence Event

A threshold may be crossed while the subsequent emergence event fails.

For example:

production capability exists

but

the first intended production process fails to produce usable output.

The lifecycle may therefore become:

Threshold Crossed → Emergence Event Attempted → Emergence Event Failed → Value Remains Potential

This is an important architectural distinction.

Emergence Readiness ≠ Successful Emergence.

Reversed Emergence Event

An emergence event may begin but reverse before a legitimate emergence determination is possible.

Example:

A digital service becomes operational but immediately fails before any material value can be realized.

VEEM allows:

Event Initiation → Event Reversal

without forcing the architecture to declare that value existed merely because activation briefly occurred.

Repeated Emergence Events

Some value may emerge repeatedly.

Examples include:

repeated service delivery; recurring energy generation; repeated transportation; recurring computation; repeated financial benefit; repeated scientific output.

VEEM must distinguish:

Initial Value Emergence

from

Repeated Value-Producing Events.

Once the governed value already exists, later events may belong to:

Value State

Value Change

or

Value Development

rather than constituting new emergence of the same value.

This prevents repeated production from being counted repeatedly as original value creation.

New Value from Existing Value

A later event may create a genuinely new value even where another value already exists.

Example:

A dataset already has operational value.

A new analytical capability later produces a new predictive value from that dataset.

The new value requires its own governed Value Context and emergence pathway.

Therefore:

Existing Value + New Capability ≠ Automatically Same Value

A new value may require:

New Value Context → New Value Origin → New Value Emergence.

Event Attribution Boundary

VEEM identifies the relationship between an event and value emergence.

It does not determine legal responsibility, ownership, entitlement, accountability, or compensation for that value.

Those questions remain outside the Module.

Therefore:

Value Emergence Event ≠ Ownership Event

Value Emergence Event ≠ Taxable Event

Value Emergence Event ≠ Payment Event

Value Emergence Event ≠ Legal Recognition Event

Value Emergence Event ≠ Accountability Determination

This separation is critical if VFM® is later combined with accounting, taxation, banking, payment, or economic governance architectures.

Internal Value Flow Control

VEEM acts as the event gate between threshold satisfaction and formal emergence determination.

The operational logic is:

No Event → Remain Emergence-Ready

Event Candidate → Assess Event

Event In Progress → Continue Observation

Event Uncertain → Hold / Clarify

Event Failed → Return to Potential / Emergence-Ready State as applicable

Event Reversed → Reassess Emergence Basis

Event Occurred → Transfer to VEDM

This makes VEEM usable as an operational governance mechanism.

Governance Outputs

VEEM may produce:

Value Emergence Event Candidate Value Emergence Event Definition Value Emergence Event Identity Value Emergence Event Type Value Emergence Event Context Value Emergence Event Timeline Value Emergence Event Boundary Value Emergence Event-to-Value Relationship Composite Emergence Event Map Value Emergence Event Materiality Assessment Value Emergence Event Evidence Basis Value Emergence Event Uncertainty Record Value

Emergence Event State Failed Emergence Event Record Reversed Emergence Event Record Governed Value Emergence Event

These outputs provide the governed basis for:

VEDM — Value Emergence Determination Module.

Use Case 1 — Banking & Project Finance:

Investment Completion vs. Value Emergence

A bank finances a large industrial project.

The borrower completes construction.

The facility appears on the balance sheet.

Equipment is installed.

The project is officially declared operational.

These facts may demonstrate that capital has been deployed and an asset exists.

They do not automatically demonstrate that the expected value has emerged.

VFM® may establish the governed value as:

sustained productive capability capable of generating the defined economic output.

VECM identifies the conditions.

VETM establishes the emergence threshold.

VEEM then identifies the actual emergence event.

That event may require:

Operational Activation → Successful Production → Usable Output → Commercially Relevant Delivery

rather than merely:

Construction Completed.

The bank can therefore distinguish:

Capital Expenditure → Completed Asset → Potential Value → Emergence Threshold → Emergence Event → Value Emergence Determination

This gives lenders, investors, restructuring teams, and public financing bodies a governed way to detect projects where:

money has been spent and assets exist, but the intended value has not yet emerged. Use Case 2 — Space Mission: Mission Activity vs. Scientific Value Emergence

A space agency launches a scientific mission.

The spacecraft reaches its destination.

The instruments activate successfully.

From a traditional project perspective, multiple major milestones have been achieved.

But suppose the governed value is:

usable scientific knowledge concerning a defined planetary phenomenon.

Then:

Launch Success ≠ Scientific Value Emergence

Orbital Arrival ≠ Scientific Value Emergence

Instrument Activation ≠ Scientific Value Emergence

Those events create or activate the potential value source.

VEEM identifies the materially relevant emergence event.

The sequence may be:

Instrument Activation → Observation → Data Acquisition → Successful Transmission → Ground Reception → Usable Scientific Dataset Produced

Only then may the relevant occurrence proceed to VEDM for determination of whether the governed scientific value has actually emerged.

This allows mission governance to distinguish:

Mission Expenditure

from

Mission Capability

from

Mission Activity

from

Mission Value.

That distinction can support mission evaluation, portfolio prioritization, continuation decisions, cost control, scientific program assessment, and comparison of alternative mission architectures.

Foundational Principles

Threshold satisfaction is not automatically value emergence.

An operational event is not automatically a Value Emergence Event.

A transaction is not automatically a Value Emergence Event.

Cost incurred is not value emerged.

Capital deployed is not value emerged.

Asset completion is not value emerged.

Capability activation is not automatically value realization.

An emergence event must remain connected to the specific governed value context.

A Value Emergence Event may be instantaneous, progressive, composite, conditional, failed, uncertain, or reversed.

The occurrence of an event must remain distinguishable from the determination of what that event means for value existence.

VEEM governs what happened at the emergence boundary; VEDM governs whether what happened establishes that value emerged.

Canonical Closing Statement

Value Emergence Event Module establishes the governed event layer through which threshold-satisfied potential value may transition toward existent value. By identifying and structuring the occurrence, activation, realization, interaction, outcome, or state change associated with value emergence, VEEM separates operational activity, transactions, expenditure, asset completion, capability creation, and technical activation from the materially relevant event through which the governed value may actually emerge. Through event identification, temporal localization, event boundaries, event-to-value relationships, materiality, beneficiary relationships, composite events, progressive emergence, uncertainty, failed events, reversals, and event-state governance, VEEM creates the evidentially identifiable transition required before Value Emergence Determination can occur. In doing so, VEEM prevents activity from being mistaken for value, cost from being mistaken for value creation, and technical completion from being mistaken for value realization, while establishing the governed bridge between emergence readiness and legitimate determination of value existence within VFM®.
