Canonical Language:

English (UCL™)

Governed Space

PHPM governs how the complete material history of a Governed Prediction is preserved across its lifecycle so that prior prediction states, versions, transitions, methodologies, assumptions, Prediction Basis states, probability and uncertainty states, communication and reliance states, revision events, outcome relationships, performance assessments, corrections, migrations, archival states, and other materially relevant lifecycle events remain historically connected and reconstructable.

It governs the transition:

Versioned Prediction Record + Material Lifecycle Events → Preserved Prediction History → Reconstructable Historical Prediction Lifecycle

is foundational principle is:

A preserved prediction history must retain not only what changed, but also what happened around the prediction as it moved through its lifecycle.

Canonical Definition

The Prediction History Preservation Module (PHPM) defines the operational governance requirements by which the complete material historical lifecycle of a Governed Prediction is preserved beyond version continuity alone.

PHPM governs:

Historical Event Preservation; Prediction State Preservation; Version History Preservation; Methodology History; Prediction Basis History; Assumption History; Probability & Uncertainty History; Horizon & Boundary History; Communication History; Reliance History; Revision History; Supersession History; Withdrawal History; Outcome Association History; Performance Assessment History; Performance Reassessment History; Correction History; Migration History;

Archive History; Historical Gap Identification; Historical Sequence Integrity; Historical Context Preservation; Historical Reconstruction Readiness.

Its primary output is:

Governed Prediction History Record

Operational Role

PHPM is the third operational module within PRCS.

Its focused operational question is:

What material historical events and contextual states must remain preserved so that the complete lifecycle of a Governed Prediction can later be reconstructed without hindsight, omission, selective retention, or historical compression?

PVCM preserves version continuity.

PHPM preserves the broader history surrounding those versions.

Version History ≠ Complete Prediction History

Internal Module Flow

Prediction Record Formation → Prediction Version Continuity → Prediction History Preservation → Prediction Record State Transition → Prediction Record Re-Entry

Current Position:

Prediction History Preservation

1. Prediction History

Prediction History is the governed chronological record of the material states and events affecting a prediction across its lifecycle.

It extends beyond:

P1 → P2 → P3

to include:

P1 → Communication → Reliance → New Basis → P2 → Revision → Supersession → Outcome → Performance → Reassessment

2. Historical Preservation

Historical Preservation means that material lifecycle events remain available as governed historical states rather than being overwritten by the latest record state.

3. Version History vs Lifecycle History

Prediction versions preserve changes in predictive content.

Lifecycle history preserves the wider governance context in which those versions existed.

Version History $\neq$ Complete Prediction History

4. Material Historical Event

A Material Historical Event is an event whose absence would materially impair:

prediction reconstruction; historical interpretation; validation; auditability; performance assessment; accountability; continuity.

5. Historical Event Types

Possible historical event types include:

Prediction Record Formation; Version Creation; Methodology Change; Prediction Basis Change; Assumption Change; Probability Change; Uncertainty Change; Horizon Change; Boundary Change; Communication; Reliance; Review; Revision; Supersession; Withdrawal; Reinstatement; Outcome Association; Performance Assessment; Performance Reassessment; Correction; Migration; Archive; Re-Entry.

6. Historical Event Identity

Each material historical event should remain identifiable.

7. Historical Event Timestamp

Each material historical event should preserve sufficient temporal anchoring.

8. Event Ordering

Historical events should remain chronologically ordered where sequence matters.

9. Sequence Integrity

A later event must not appear to have preceded an earlier event.

Historical Order $\neq$ Editable Narrative

10. Event Source

PHPM may preserve the source that generated or recorded a historical event.

11. Event Actor

Where material, the human, model, agent, organization, or system responsible for a historical event should remain identifiable.

12. Event Context

Historical events should preserve enough context to remain meaningful.

A timestamp alone may not explain what changed.

13. Prediction State Preservation

The applicable Prediction State at each material historical point should remain reconstructable.

14. Current State vs Historical State

The current state must not replace prior states.

Current State $\neq$ Historical State

15. Original Prediction Preservation

The original Governed Prediction should remain historically available even after multiple revisions.

16. Intermediate State Preservation

Material intermediate prediction states should remain preserved.

17. Final Prediction Preservation

The final prediction state should remain preserved as one part of the lifecycle.

It must not replace the earlier states.

18. Historical Compression

Historical Compression occurs when a complex prediction lifecycle is reduced to an oversimplified record.

Example:

Original Prediction $\rightarrow$ Final Prediction

while omitting three material revisions.

19. Historical Compression Risk

Compression may distort:

revision trajectory; performance interpretation; information timing; reliance history.

20. First + Final $\neq$ Complete History

First Prediction + Final Prediction $\neq$ Complete Prediction History by Default

21. Methodology History

PHPM preserves which methodology and methodology version applied at each material predictive state.

22. Methodology Transition History

Example:

Methodology v1 $\rightarrow$ Methodology v2 $\rightarrow$ Methodology v3

should remain connected to the prediction versions produced under each methodology.

23. Historical Methodology Fidelity

A historical prediction must remain associated with the methodology that actually existed at the time.

24. Methodology Upgrade Boundary

Methodology Upgrade $\neq$ Historical Methodology Replacement

25. Prediction Basis History

Material Prediction Basis changes should remain historically traceable.

26. Basis Addition History

New information entering the Prediction Basis should remain identifiable.

27. Basis Removal History

Material information removed from the Prediction Basis should remain identifiable where it affects predictive interpretation.

28. Basis Timing

Historical records should preserve when material Prediction Basis elements became available.

29. Future Information Boundary

Later information must not be silently represented as though it existed earlier.

Future Information $\neq$ Historical Prediction Basis

30. Assumption History

Material assumptions should remain historically associated with applicable prediction states.

31. Assumption Change History

The record should preserve:

Assumption A1 $\rightarrow$ Assumption A2

where the change materially affected the prediction.

32. Hidden Assumption History

Where previously hidden assumptions are later identified, the discovery event should remain distinct from the original historical state.

33. Probability History

PHPM preserves the complete material sequence of probability states.

Example:

31% $\rightarrow$ 48% $\rightarrow$ 67% $\rightarrow$ 89%

34. Probability Sequence Integrity

The final probability should not overwrite earlier values.

35. Probability History and Performance

Historical probabilities may later support calibration and lead-time analysis.

PHPM preserves them.

36. Uncertainty History

Material uncertainty states should remain preserved.

37. Confidence History

Where confidence is separately represented, its historical states should remain version-specific.

38. Range History

Changes in predictive ranges should remain reconstructable.

39. Conditionality History

Conditions attached to a prediction should remain historically traceable.

40. Horizon History

Changes in Prediction Horizon should remain preserved.

41. Boundary History

Changes in Predictive Boundary should remain preserved.

42. Scope Narrowing

A narrower later scope must not replace the broader original scope.

43. Scope Expansion

A broader later scope should remain distinguishable from the original boundary.

44. Scenario History

Scenario-specific prediction paths should remain reconstructable.

45. Predictor History

Where the predictor changes, historical attribution should remain preserved.

46. Model History

Model versions associated with predictions should remain historically traceable.

47. Human-AI Contribution History

Where human and AI contributions materially change over time, relevant contribution states may be preserved.

48. Collective Prediction History

For collective predictions, PHPM may preserve:

participant structure; aggregation method; concentration; independence conditions; collective probability states.

49. Prediction Market History

Prediction-market history may preserve:

market state; probability snapshots; resolution rule; rule changes; relevant liquidity or participant context where governed.

50. Final Market State Boundary

Final Market Price $\neq$ Complete Market Prediction History

51. Communication History

PHPM preserves material communication events.

52. Communication Version

The exact prediction version communicated should remain identifiable.

53. Communication Audience

Where material, the recipient or audience class should remain identifiable.

54. Communication Timing

Communication time may differ from prediction formation time.

55. Communication Representation

Material changes in representation should remain historically visible where interpretation may be affected.

56. Reliance History

PHPM preserves material reliance events governed under PCRS.

57. Reliance Version

The exact prediction version relied upon should remain identifiable.

58. Reliance Timing

The time of reliance should remain historically connected to the prediction state available at that time.

59. Decision-Time Record

Where prediction use affected a decision, the decision-time prediction state should remain reconstructable.

60. Decision-Time Prediction ≠ Final Prediction

61. Intervention History

Where prediction reliance triggered intervention, PHPM may preserve:

Prediction → Reliance → Intervention → Changed Conditions

62. Intervention Timing

The time of intervention may be essential to performance interpretation.

63. Self-Fulfilling History

Where a prediction contributed to producing the predicted outcome, the relevant influence history should remain preserved.

64. Self-Negating History

Where a prediction contributed to preventing the predicted outcome, the relevant intervention history should remain preserved.

65. Review History

PMRS review events should remain historically identifiable.

66. Review Trigger History

The event or condition triggering review should remain traceable where available.

67. Revision History

PHPM preserves the full sequence of revisions.

68. Revision Reason History

Where governed, reasons for revision should remain historically available.

69. Supersession History

Superseded prediction states should remain part of the Prediction History.

70. Withdrawal History

Withdrawal events should remain preserved.

71. Withdrawal Reason

Where available, the governed reason for withdrawal should remain traceable.

72. Withdrawal ≠ Disappearance

A withdrawn prediction must remain historically reconstructable.

73. Outcome Association History

POFPS outcome-association records should remain connected to the historical prediction state they evaluate.

74. Outcome Version History

Where Outcome References are corrected or updated, the applicable history should remain preserved.

75. Performance Assessment History

Predictive Performance assessments should remain historically attached to the prediction states and outcome references they used.

76. Performance Reassessment History

Later reassessment should not erase the earlier assessment.

77. Performance Reassessment ≠ Performance Replacement

78. Correction History

Historical corrections should remain traceable.

79. Original + Correction

Where a record is corrected:

Original State → Correction Event → Corrected Representation

should remain reconstructable.

80. Silent Correction Risk

A correction that overwrites historical content without trace creates historical distortion.

81. Annotation History

Historical annotations may add explanatory context without changing original predictive meaning.

82. Annotation ≠ Original Prediction Content

83. Migration History

Prediction Record migration across systems should remain historically traceable.

84. Migration Source and Destination

Where material, migration history should preserve:

originating system; destination system; migration time; record identity continuity.

85. Migration ≠ New Prediction Origin

86. Copy History

Copies may be created for operational or archival reasons.

Copies should remain distinguishable from new prediction origins.

87. Archive History

Archival events should remain historically identifiable.

88. Archive State

The time and status of archival transition should remain preserved where material.

89. Archive ≠ Deletion

90. Retention History

Where retention actions materially alter availability, those actions may require historical reference.

91. Disposal History

Where lawful record disposal occurs, the disposal event should remain distinguishable from historical rewriting where governance permits.

92. Historical Gap

A Historical Gap is a missing material lifecycle segment or state.

93. Gap Types

Possible gaps include:

Missing Prediction Version

Missing Timestamp

Missing Methodology Reference

Missing Prediction Basis State

Missing Probability State

Missing Communication Event

Missing Reliance Event

Missing Revision Event

Missing Outcome Reference

Missing Performance Record

94. Gap Severity

Historical Gaps may be classified as:

Minor

Material

Critical

Unable to Determine

depending on reconstruction impact.

95. Gap Localization

PHPM should identify where the historical gap occurs.

96. Gap ≠ Automatic Invalidity

A missing historical segment may weaken reconstruction without invalidating every surviving state.

97. Historical Reconstruction Readiness

PHPM may assess whether the preserved history is sufficient for later reconstruction.

Possible states:

Fully Reconstruction-Ready

Substantially Reconstruction-Ready

Partially Reconstruction-Ready

Material Historical Gaps

Not Reconstruction-Ready

Unable to Determine

98. Reconstruction Question Set

A sufficiently preserved Prediction History should support questions such as:

What was predicted at time T?

Which version existed?

What probability applied?

What methodology was active?

What information was available?

What assumptions applied?

Was the prediction communicated?

Was it relied upon?

Had intervention occurred?

What changed next?

Which outcome later became associated?

Which performance assessment followed?

99. Historical Provenance

PHPM preserves sufficient provenance for historical events and states.

100. Historical Attribution

Material events should remain attributable to the relevant:
predictor; model; system; organization; human actor; process.

101. Historical Integrity

PHPM supports protection against:
selective deletion; silent replacement; version compression; timestamp rewriting; sequence manipulation;
detached performance history; detached communication history; detached outcome history.

102. Selective Preservation Risk

Systems may preserve:
successful predictions
while deleting:
failed predictions.
PHPM treats this as a historical continuity risk.

103. Survivorship Distortion

A preserved history containing only surviving records may not represent complete Prediction History.

104. Publication Bias History

Publicly visible prediction history may differ from complete internal history.
PHPM can preserve that distinction where relevant.

105. Visible History ≠ Complete History

106. Historical Population Preservation

Where performance depends on a prediction population, PHPM should support preservation of the historical population structure.

107. Prediction Count Integrity

Deleted or duplicate records should not silently alter historical prediction counts.

108. Historical Independence Context

Where prediction independence matters, relevant relationships may need preservation.

109. Historical Context Sufficiency

Prediction history is not just a sequence of numbers.
Context necessary to interpret those numbers must remain preserved.

110. Machine-Readable History

PHPM should support machine-readable historical event structures.

111. Historical Event Graph

Implementations may represent Prediction History as:
Prediction State Nodes + Historical Event Relationships
rather than a simple flat list.

112. Machine Reconstruction

A machine-readable history should support temporal queries.

Examples:

Show prediction state on 1 March 2028.

Show all revisions before decision time.

Show probability history before outcome resolution.

Show all withdrawn versions.

113. Historical Query Integrity

Machine queries should not silently default to the latest version where a historical-time query was requested.

114. Latest-State Bias

AI or software systems may incorrectly answer historical questions using only current state.

PHPM guards against this.

Latest State $\neq$ Historical Answer

115. Cross-System Historical Preservation

Prediction History may span several systems.

PHPM should preserve semantic continuity across them.

116. Historical Interoperability

Transferred historical events should retain the same governance meaning after migration.

117. Historical Conflict

Different systems may preserve conflicting historical states.

The conflict should remain explicit.

118. Reconciliation History

If conflicting history is reconciled, the reconciliation event should itself become part of the historical record.

119. Reconciliation $\neq$ Erasure of Conflict

120. History Preservation State

PHPM may classify Prediction History as:

History Preserved

History Preserved with Qualification

Partially Preserved

Material Historical Gaps

History Integrity Concern

History Not Sufficiently Preserved

Unable to Determine

121. Governance Requirements

A governed PHPM implementation should be able to:

1. identify Material Historical Events; 2. preserve Historical Event Identity; 3. preserve Historical Event Timestamps; 4. maintain Event Ordering; 5. preserve Sequence Integrity; 6. preserve Event Source; 7. preserve Event Actor; 8. preserve Event Context; 9. preserve Prediction States; 10. distinguish current from historical state; 11. preserve Original Prediction; 12. preserve Intermediate Prediction States; 13. preserve Final Prediction; 14. prevent Historical Compression; 15. preserve Methodology History; 16. preserve Methodology Transitions; 17. preserve Historical Methodology Fidelity; 18. preserve Prediction Basis History; 19. preserve Basis Addition; 20. preserve Basis Removal; 21. preserve Basis Timing; 22. prevent Future Information from entering historical basis; 23. preserve Assumption History; 24. preserve Assumption Changes; 25. preserve discovery of previously hidden assumptions;
26. preserve Probability History; 27. preserve Probability Sequence Integrity; 28. preserve Uncertainty History; 29. preserve Confidence History; 30. preserve Range History; 31. preserve Conditionality History; 32. preserve Horizon History; 33. preserve Boundary History; 34. preserve Scope Narrowing; 35. preserve Scope Expansion; 36. preserve Scenario History; 37. preserve Predictor History; 38. preserve Model History; 39. preserve Human-AI contribution history where material; 40. preserve Collective Prediction History; 41. preserve Prediction Market History; 42. distinguish final market state from complete market history; 43. preserve Communication History; 44. preserve communicated Prediction Version; 45. preserve Communication Audience where material; 46. preserve Communication Timing; 47. preserve material Communication Representation; 48. preserve Reliance History; 49. preserve relied-upon Prediction Version; 50. preserve Reliance Timing; 51. preserve Decision-Time Prediction; 52. preserve Intervention History; 53. preserve Intervention Timing; 54. preserve self-fulfilling context; 55. preserve self-negating context; 56. preserve Review History; 57. preserve Review Trigger History; 58. preserve Revision History; 59. preserve Revision Reasons where governed; 60. preserve Supersession History; 61. preserve Withdrawal History; 62. preserve Withdrawal Reason where available; 63. prevent withdrawal from causing historical disappearance; 64. preserve Outcome Association History; 65. preserve Outcome Version History; 66. preserve Performance Assessment History; 67. preserve Performance Reassessment History; 68. prevent reassessment from erasing earlier assessments; 69. preserve Correction History; 70. preserve Original + Correction relationships; 71. prevent Silent Correction; 72. preserve Annotation History; 73. distinguish annotation from original prediction content; 74. preserve Migration History; 75. preserve Migration Source and Destination; 76. prevent migration from creating false origin; 77. preserve Copy History; 78. preserve Archive History; 79. distinguish Archive from Deletion; 80. preserve material Retention History; 81. preserve lawful Disposal History where applicable; 82. identify Historical Gaps; 83. classify Gap Type; 84. classify Gap Severity; 85. localize Historical Gaps; 86. prevent gaps from becoming automatic invalidity; 87. determine Historical Reconstruction Readiness; 88. support historical reconstruction questions; 89. preserve Historical Provenance; 90. preserve Historical Attribution;
91. preserve Historical Integrity; 92. prevent Selective Preservation; 93. identify Survivorship Distortion; 94. preserve Public vs Complete History distinction; 95. preserve Historical Prediction Population where material; 96. preserve Prediction Count Integrity; 97. preserve historical independence context where material; 98. preserve Historical Context Sufficiency; 99. support Machine-Readable History; 100. support Historical Event Graph structures; 101. support Machine Reconstruction; 102. preserve Historical Query Integrity; 103. prevent Latest-State Bias; 104. support Cross-System Historical Preservation; 105. support Historical Interoperability; 106. preserve Historical Conflict; 107. preserve Reconciliation History; 108.

prevent reconciliation from erasing conflict history; 109. determine History Preservation State; 110. preserve complete prediction lifecycle traceability; 111. produce a Governed Prediction History Record.

122. Governance Logic

PHPM applies the following operational logic:

Does a governed Prediction Record with version continuity exist?

If no:

→ complete Prediction History Preservation cannot yet be established.

If yes:

→ identify Material Historical Events.

Which events materially affect historical reconstruction?

→ preserve those events.

Are prediction versions chronologically connected?

If no:

→ identify Version History Gap.

If yes:

→ preserve Version Sequence.

Did Methodology, Prediction Basis, assumptions, probability, uncertainty, horizon, boundary, predictor, model, or scenario change?

If yes:

→ preserve each material historical state.

Was the prediction communicated or relied upon?

If yes:

→ preserve the exact applicable version and time.

Did review, revision, supersession, withdrawal, or reinstatement occur?

If yes:

→ preserve each event.

Did intervention materially affect the prediction lifecycle?

If yes:

→ preserve relevant intervention history.

Did an outcome later become associated?

If yes:

→ preserve Outcome Association history.

Was Predictive Performance assessed or reassessed?

If yes:

→ preserve each assessment and the historical prediction state it evaluated.

Were corrections or annotations added?

If yes:

→ preserve the original state and the corrective event.

Was the record migrated, copied, archived, reconciled, or partially disposed?

If yes:

→ preserve the applicable continuity event.

Are material historical segments missing?

If yes:

→ identify, localize, and qualify Historical Gaps.

Then:

→ determine Reconstruction Readiness;

→ determine History Preservation State;

→ preserve historical sequence;

→ preserve provenance;

→ preserve complete lifecycle traceability;

→ pass preserved history into Prediction Record State Transition governance.

Canonical transition:

Material Prediction Lifecycle Events → Preserved Historical Sequence → Reconstructable Prediction History

123. Minimum Implementation Framework

A. Prediction Record ID

Persistent reference to the governed Prediction Record.

B. Historical Event ID

Unique reference for each material historical event.

C. Event Type

Version, communication, reliance, revision, withdrawal, outcome, performance, correction, migration, archive, or other governed event.

D. Event Timestamp

Temporal anchor for the historical event.

E. Prediction State Reference

Applicable historical Prediction Version or state.

F. Methodology / Model Context

Applicable methodology and model versions.

G. Basis / Assumption Context

Applicable Prediction Basis and assumption state.

H. Probability / Uncertainty Context

Applicable probability, confidence, range, uncertainty, and conditionality state.

I. Horizon / Boundary Context

Applicable Prediction Horizon and Predictive Boundary.

J. Communication / Reliance Context

Applicable PCRS-governed communication and reliance history.

K. Revision / Status Context

Review, revision, supersession, withdrawal, reinstatement, and related history.

L. Outcome / Performance Context

Applicable outcome-association and Predictive Performance history.

M. Provenance & Actor Context

Source, actor, system, creator, or transformation responsible for the historical event.

N. Historical Gap & Qualification

Missing state, missing event, disputed sequence, approximate timestamp, or other historical qualification.

O. History Preservation State

Overall preservation, integrity, reconstructability, and traceability status.

124. Governance Outputs

PHPM may produce:

Governed Prediction History Record Historical Event Record Historical Event Sequence Prediction State History Version History Methodology History Prediction Basis History Assumption History Probability History Uncertainty History Horizon History Boundary History Predictor / Model History Collective Prediction History Prediction Market History Communication History Reliance History Decision-Time Prediction Record Intervention History Review History Revision History Supersession History Withdrawal History Outcome Association History Performance Assessment History Performance Reassessment History Correction History Migration History Archive History Historical Gap Record Historical Reconstruction Readiness State History Preservation State Historical Provenance Record Historical Integrity Record Prediction Lifecycle Traceability Record

The primary output is:

Governed Prediction History Record

This becomes governed input to:

PRSTM — Prediction Record State Transition Module

125. Critical Distinctions

Version History $\neq$ Complete Prediction History

Current State $\neq$ Historical State

First + Final $\neq$ Complete Prediction History by Default

Methodology Upgrade $\neq$ Historical Methodology Replacement

Future Information $\neq$ Historical Prediction Basis

Decision-Time Prediction $\neq$ Final Prediction

Final Market Price $\neq$ Complete Market Prediction History

Withdrawal $\neq$ Disappearance

Performance Reassessment $\neq$ Performance Replacement

Annotation $\neq$ Original Prediction Content

Migration $\neq$ New Prediction Origin

Archive $\neq$ Deletion

Historical Gap $\neq$ Automatic Invalidity

Visible History $\neq$ Complete History

Latest State $\neq$ Historical Answer

Reconciliation $\neq$ Erasure of Conflict

Historical Preservation $\neq$ Historical Simplification

Historical Record $\neq$ Latest Database State

126. Enterprise Application

PHPM can govern Prediction History Preservation across:

AI forecasting systems; enterprise forecasting; investment and financial forecasting; insurance; prediction markets; industrial prediction; predictive maintenance; supply-chain forecasting; technology forecasting; public-sector forecasting; geopolitical forecasting; expert forecasting; Human-AI systems; autonomous agents; model ensembles; multi-agent predictive systems.

Its function remains constant:

preserve the complete material history surrounding the prediction so that future users can reconstruct not only what the prediction became, but how it got there.

127. Use Case 1 — The Forecast Was Revised Five Times but Only Two Versions Survive

An AI forecasting platform predicts:

P1 — 22% probability

then:

P2 — 31%

then:

P3 — 47%

then:

P4 — 68%

then:

P5 — 86%

The event occurs.

The system preserves only:

P1

and:

P5

and later reports:

"The model correctly increased confidence from 22% to 86%."

But the complete historical record is missing:

P2; P3; P4; timing of each change; new information entering the Prediction Basis; whether any intermediate prediction was relied upon.

The critical governance question is:

Can a two-point history legitimately represent a five-stage predictive lifecycle?

PHPM answers:

Not by default.

The missing versions may materially affect:

lead-time performance; revision trajectory; decision-time interpretation; calibration; historical methodology analysis.

PHPM therefore records:

Historical Gap: P2–P4 missing

History Preservation State: Partially Preserved

Reconstruction Readiness: Material Historical Gaps

The system may still know the first and final states.

But:

First + Final $\neq$ Complete Prediction History by Default

128. Use Case 2 — The Prediction Was Correct, but the Information Arrived Before the Predictor

Updated the Record

A corporate forecasting team predicts:

30% probability that Company X will cancel a major acquisition.

At 10:00, a confidential internal decision is made to cancel the acquisition.

At 10:20, several team members learn of the decision.

At 10:35, the official forecasting system updates:

30% $\rightarrow$ 97%

At 11:00, the cancellation becomes public.

Later, the platform evaluates the 97% prediction as highly successful forecasting.

The critical governance question is:

Was the 97% state still a prediction, or had the predictor already become outcome-informed?

PHPM preserves the historical sequence:

10:00 — Operational decision

10:20 — Outcome-related information received

10:35 — Prediction revised to 97%

11:00 — Public announcement

The history does not itself conclude misconduct.

But it preserves the informational sequence needed for PBAS, POFPS, and Predictor–Reality Proximity interpretation.

Without PHPM, the record might contain only:

97% $\rightarrow$ Outcome occurred

and falsely suggest exceptional predictive skill.

Future Information ≠ Historical Prediction Basis

Outcome Knowledge ≠ Predictive Capability

Historical Sequence Integrity Is Essential to Performance Interpretation

129. Canonical Boundary

PHPM governs the preservation of the complete material historical lifecycle surrounding a Governed Prediction, including historical prediction states, version sequence, methodology, Prediction Basis, assumptions, probability and uncertainty, horizon, boundary, communication, reliance, intervention, review, revision, supersession, withdrawal, outcome association, Predictive Performance, corrections, migration, archival states, Historical Gaps, provenance, integrity, and reconstruction readiness. It does not create the initial Prediction Record, determine whether a new Prediction Version is required, govern the lifecycle status transition itself, determine lifecycle re-entry, form predictions, establish Operational Reality, or independently determine Predictive Performance.

PRFM owns:

Prediction Record Formation

PVCM owns:

Prediction Version Continuity

PHPM owns:

Prediction History Preservation

PRSTM subsequently owns:

Prediction Record State Transition

PRRM subsequently owns:

Prediction Record Re-Entry

130. Canonical Closing Statement

Prediction history is more than a list of versions. It is the sequence of information, assumptions, revisions, communications, decisions, interventions, outcomes, and assessments that gives those versions historical meaning.

PHPM preserves that sequence so that the final prediction cannot become the whole story, the visible prediction cannot become the only history, and later knowledge cannot silently rewrite what was knowable earlier.

A prediction becomes historically trustworthy only when its path through time remains reconstructable.
