

PRRM — Prediction Record Re-Entry Module

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: PGA™ — Prediction Governance Architecture

Parent Standard:

PRCS — Prediction Record & Continuity Standard

Operational Layer: Prediction Record & Historical Continuity

Category:

Governance & Enforcement

Subcategory:

Prediction Governance

Type: Parent Standard Module

Governed Space:

Prediction Record Re-Entry

Version: 1.0

Status: Canonical · Open Module

Effective Date: 11 September 2026

Compatibility: OOF® Methodology OS™ · GOA™ · ORA™ · VALIDOS™ · INTEGROS® · ADIT® · AGA™ · AIG® · ASGA™ · CLIA® · SIMULOS®

AI-Readable: Yes

Authority: OOF®

Protection:

MIP® — Methodological Intellectual Property

Canonical Language:

English (UCL™)

Governed Space

PRRM governs how a historically existing Governed Prediction Record may legitimately return to operational, analytical, communicative, evaluative, or predictive use after retirement, archival, withdrawal, extended inactivity, lifecycle closure, system migration, changed operational conditions, or another meaningful lifecycle exit.

It governs the transition:

Historical / Inactive Prediction Record → Re-Entry Evaluation → Re-Entry Classification → Re-Entered Prediction Record State

Its foundational principle is:

A prediction returning to use must carry its history back with it.

Canonical Definition

The Prediction Record Re-Entry Module (PRRM) defines the operational governance requirements by which a historically existing Prediction Record may re-enter a governed lifecycle without silently losing its original identity, lineage, methodology context, historical assumptions, Prediction Basis, probability state, prior outcomes, Predictive Performance, withdrawal or retirement history, or other material historical conditions.

PRRM governs:

Re-Entry Eligibility; Re-Entry Trigger;

Re-Entry Purpose; Re-Entry Authority; Historical Identity Continuity; Original Prediction Reference; Re-Entry Classification; Same Prediction vs Derived Prediction vs New Prediction; Context Change Assessment; Methodology Change Assessment; Prediction Basis Change Assessment; Assumption Change Assessment; Horizon Change; Boundary Change; Model Change; Predictor Change; Outcome-Known Re-Entry; Performance-Known Re-Entry; archived-record reactivation; retired-record reactivation; withdrawn-record return; migrated-record re-entry; cross-system re-entry; scenario reuse; training-data reuse boundary; benchmarking reuse; historical simulation reuse; prediction-template reuse boundary; duplicate-origin prevention; re-entry lineage; re-entry qualification; re-entry continuity; re-entry traceability.

Its primary output is:

Governed Prediction Record Re-Entry Determination

Operational Role

PRRM is the fifth and final operational module within PRCS.

Its focused operational question is:

When a historically existing Prediction Record returns to use, under what conditions may it continue as the same governed prediction lineage, become a derived prediction, or require formation of a new Prediction Record?

PRRM does not create the original prediction.

PRFM owns initial Prediction Record Formation.

PRRM governs the return of historical predictive material after meaningful lifecycle exit.

Re-Entry $\neq$ New Origin by Default

Internal Module Flow

Prediction Record Formation → Prediction Version Continuity → Prediction History Preservation → Prediction Record State Transition → Prediction Record Re-Entry

Current Position:

Prediction Record Re-Entry

1. Prediction Record Re-Entry

Prediction Record Re-Entry occurs when a historically existing Prediction Record is brought back into a governed operational or analytical context after meaningful lifecycle separation.

2. Re-Entry Trigger

Possible triggers include:

renewed operational relevance; recurrence of similar conditions; reactivation of an archived forecast; model reactivation; scenario reuse; regulatory or market change; research reuse; new decision context;

system restoration; migration; benchmark analysis; historical comparison.

3. Re-Entry Purpose

The purpose of re-entry should remain explicit.

Possible purposes include:

Operational Prediction

Historical Comparison

Benchmarking

Research

Simulation

Model Evaluation

Scenario Reuse

Training / Learning Reference

Decision Support

4. Purpose Matters

The same historical Prediction Record may legitimately re-enter for:

analysis

without being legitimate for:

current operational reliance.

Historical Reuse $\neq$ Operational Revalidation

5. Re-Entry Eligibility

A historical record should not automatically become operationally current merely because it still exists.

6. Re-Entry Eligibility States

Possible states:

Re-Entry Eligible

Re-Entry Eligible with Qualification

Analytical Reuse Only

Requires New Prediction Formation

Re-Entry Not Supported

Unable to Determine

7. Historical Identity Continuity

PRRM first asks:

Does the returning predictive object remain sufficiently connected to the original Prediction Record?

8. Same Prediction Lineage

A returning prediction may remain part of the same historical lineage where:

Prediction Object remains materially continuous; predictive purpose remains sufficiently related; historical identity remains traceable; re-entry does not falsely reset origin.

9. Same Prediction ≠ Same Current Meaning

A prediction may preserve lineage while its current meaning has materially changed.

10. New Prediction Boundary

A sufficiently transformed predictive object may require:

New Prediction Record Formation

rather than re-entry.

11. Derived Prediction

A historical prediction may become source material for a new prediction.

This may create:

Derived Prediction

rather than continuation of the original Prediction Record.

12. Derived Prediction ≠ Re-Entered Original Prediction

13. Reused Methodology ≠ Reused Prediction

A historical methodology may be reused while a completely new Prediction Record is formed.

14. Reused Prediction Template ≠ Same Prediction Identity

15. Re-Entry Classification

PRRM may classify re-entry as:

Same Prediction Re-Entry

Same Lineage, New Version

Derived Prediction

Historical Reference Only

Analytical Reuse

New Prediction Required

Unable to Determine

16. Re-Entry Authority

Where reactivation requires governance approval, applicable authority should remain identifiable.

17. Automated Re-Entry

Systems may automatically identify historical predictions as candidates for re-entry.

Automatic identification does not itself establish legitimacy.

18. Automated Candidate ≠ Governed Re-Entry

19. Human Re-Entry Decision

Where human review determines re-entry classification, that decision should remain attributable.

20. Hybrid Re-Entry

A machine may identify the record while governance process determines whether re-entry is legitimate.

21. Re-Entry Timestamp

The time of re-entry should remain distinct from the original Prediction Record origin.

22. Original Origin vs Re-Entry Time

Original Record Origin $\neq$ Re-Entry Timestamp

Both should remain preserved.

23. Re-Entry Must Not Reset Origin

A prediction formed in 2026 and re-entered in 2030 must not appear as though its historical origin were 2030.

24. Archive Re-Entry

An archived Prediction Record may return to use.

Archive exit should preserve:

archive state; archive duration; re-entry trigger; re-entry time; resulting state.

25. Archived $\neq$ Forgotten

26. Retirement Re-Entry

A retired Prediction Record may become relevant again if conditions materially recur.

27. Retirement $\neq$ Permanent Historical Irrelevance

28. Withdrawal Re-Entry

A withdrawn prediction may later become relevant again.

The withdrawal event must remain part of history.

29. Re-Entry After Withdrawal $\neq$ Withdrawal Never Happened

30. Suspension vs Re-Entry

Short-term suspension and normal reinstatement may remain within PRSTM.

Longer or materially changed lifecycle return may require PRRM.

31. Reinstatement $\neq$ Re-Entry by Default

32. Lifecycle Gap

PRRM should preserve the period during which the Prediction Record was inactive, archived, retired, or withdrawn.

33. Lifecycle Gap $\neq$ Missing History

A deliberate inactive period is not the same as a Historical Gap.

34. Re-Entry Context Assessment

PRRM evaluates whether the operational context has materially changed since the prediction last existed in active use.

35. Context Change Categories

Possible changes include:

temporal context; geographic context; market context; regulatory context; technical context; social context; organizational context; infrastructure context; decision context.

36. Context Continuity

Where context remains materially comparable, same-lineage re-entry may be more defensible.

37. Context Drift

Where context has substantially changed, re-entry may require qualification or new prediction formation.

38. Same Event Type ≠ Same Predictive Context

39. Prediction Object Continuity

The underlying Prediction Object should be evaluated for continuity.

40. Object Persistence

Some predictive objects remain persistent over long periods.

Examples:

infrastructure asset; organization; technology; market; long-term project.

41. Object Transformation

If the Prediction Object itself has materially transformed, historical identity may no longer be sufficient for same-prediction re-entry.

42. Predictive Purpose Continuity

A historical prediction used for one purpose may not automatically be legitimate for another.

43. New Purpose Boundary

Example:

Original purpose:

Strategic research

Re-entry purpose:

Automated trading execution

This may require substantially different governance.

44. Purpose Change ≠ Automatic Continuity

45. Horizon Reassessment

Prediction Horizon should be reassessed at re-entry.

46. Expired Horizon

A prediction whose original horizon has expired cannot simply be reactivated with the same horizon as though time had not passed.

47. New Horizon

A new horizon may require:

new version; derived prediction; new Prediction Record.

48. Horizon Reset ≠ Historical Horizon Erasure

49. Boundary Reassessment

Predictive Boundary should be reassessed.

50. Geographic Re-Entry

A historical prediction about one jurisdiction should not automatically re-enter for another.

51. Population Re-Entry

Changes in applicable population may materially alter predictive meaning.

52. Methodology Reassessment

The historical methodology should be evaluated for current applicability.

53. Methodology Still Applicable

Where methodology remains applicable, re-entry may preserve same-lineage continuity.

54. Methodology Obsolescence

A historically valid methodology may become obsolete.

55. Historical Validity ≠ Current Applicability

56. Methodology Upgrade

A new methodology may produce a new version or derived prediction.

The historical methodology remains preserved.

57. Model Reassessment

Where AI models generated the original prediction, model status should be reassessed.

58. Retired Model

A retired model may no longer be operationally usable even if its historical predictions remain valuable.

59. Model Upgrade

A new model generation may materially change predictive conditions.

60. Model Upgrade ≠ Historical Model Rewrite

61. Prediction Basis Reassessment

The historical Prediction Basis should be distinguished from the basis available at re-entry.

62. Historical Basis vs Current Basis

Historical Prediction Basis $\neq$ Current Prediction Basis

63. Basis Refresh

New information may require refreshed predictive formation.

64. Stale Basis

A Prediction Record may be historically intact but operationally stale.

65. Historical Integrity $\neq$ Current Predictive Sufficiency

66. Assumption Reassessment

Historical assumptions should be reviewed where relevant.

67. Expired Assumption

An assumption valid during original prediction formation may no longer hold.

68. Assumption Drift

Changes in assumptions may require new version or new prediction formation.

69. Conditional Prediction Re-Entry

Conditional predictions may re-enter only if their conditions remain meaningful or are explicitly re-established.

70. Probability Reassessment

Historical probability should not automatically become current probability.

71. Historical Probability $\neq$ Current Probability

Example:

2027 probability: 70%

does not mean:

2031 probability: 70%

72. Probability Carryover Risk

Reusing historical probability without current methodological basis may create false precision.

73. Uncertainty Reassessment

Current uncertainty may materially differ from historical uncertainty.

74. Confidence Reassessment

Historical confidence should not automatically be inherited.

75. Outcome-Known Re-Entry

A prediction may re-enter after its original outcome is already known.

This creates a critical boundary.

76. Known Outcome ≠ New Prediction

A prediction whose historical outcome is known cannot be reactivated as though the same outcome remained uncertain.

77. Historical Outcome Reference

Such a record may legitimately re-enter for:

performance analysis; benchmarking; methodology comparison; training; simulation; historical research.

78. Outcome-Known Operational Reuse

Operational reuse should require a genuinely new predictive target or future event.

79. Performance-Known Re-Entry

A historical prediction may already have established Predictive Performance.

That performance history must follow the record into re-entry.

80. Re-Entry Does Not Reset Performance

Re-Entry ≠ Performance Reset

81. Historical Failure Re-Entry

A historically failed prediction may still provide methodological or analytical value.

Failure does not require historical deletion.

82. Historical Success Re-Entry

A historically successful prediction must not be treated as automatically reliable in a new context.

83. Historical Success ≠ Current Predictive Validity

84. Performance Context Continuity

Where past performance is referenced at re-entry, context comparability should remain visible.

85. Decision-Time Reuse

A historical prediction may be surfaced to support a new decision.

The system should distinguish:

Historical Prediction Reference

from:

Current Governed Prediction

86. Historical Reference ≠ Current Decision Prediction

87. Communication Re-Entry

A historical prediction may be republished.

Republishing should not make it appear newly predicted.

88. Republishing ≠ New Prediction Formation

89. Publication Date vs Prediction Date

Both should remain explicit.

90. Reliance Re-Entry

A historical record may regain reliance eligibility only where PCRS conditions are met.

PRRM does not itself establish reliance legitimacy.

91. Re-Entry ≠ Reliance Eligibility

92. Cross-System Re-Entry

Historical predictions may return through a different technical platform.

93. System Change ≠ Prediction Origin Change

94. Migration Continuity

Original Prediction Record identity should remain preserved across migration.

95. Legacy System Recovery

A prediction restored from legacy storage may re-enter current governance.

96. Recovery Timestamp ≠ Prediction Origin Timestamp

97. Duplicate Origin Risk

Systems may accidentally create a new Prediction Record for a historically existing prediction during re-entry.

PRRM should detect potential duplicate origin.

98. Duplicate Re-Entry ≠ New Independent Prediction

99. Canonical Record Reference

Where multiple historical copies exist, re-entry should preserve linkage to the canonical or best-established historical record where governance establishes one.

100. Conflicting Historical Copies

If copies conflict, the conflict should remain visible.

101. Re-Entry Conflict

Different systems may classify the returning record differently.

Example:

System A: Same Prediction Re-Entry

System B: New Prediction Required

PRRM should preserve the governance conflict until resolved.

102. Conflict ≠ Permission to Merge Histories

103. Derived Prediction Lineage

Where a new prediction is derived from the historical record, lineage should remain explicit.

Conceptually:

Historical Prediction P1 → Derived Prediction D1

104. New Origin with Historical Lineage

A derived prediction may have:

new Prediction Record origin

while preserving:

historical lineage reference

to the earlier prediction.

105. New Origin ≠ No Historical Relationship

106. Scenario Reuse

Historical scenario predictions may be reused for new scenario analysis.

The historical scenario and new scenario should remain distinguishable.

107. Scenario Similarity ≠ Prediction Identity

108. Benchmarking Reuse

Historical Prediction Records may re-enter for benchmark comparison.

This does not reactivate them as live predictions.

109. Benchmarking ≠ Operational Re-Entry

110. Simulation Reuse

Historical predictions may be injected into simulation environments.

SIMULOS® may govern broader simulation structure.

PRRM preserves whether the historical prediction is being:

reused

rather than:

re-issued as current prediction.

111. Simulation Use ≠ Prediction Reactivation

112. Training-Data Reuse

Historical Prediction Records may be used as AI training or evaluation material.

113. Training Use Boundary

Training use does not create current predictive status.

114. Training Data ≠ Active Prediction Population

115. AI Memory Re-Entry

An AI system may retrieve an old prediction from memory and surface it in a new context.

MGIA™ may govern broader memory structures.

PRRM governs the Prediction Record continuity question.

116. Retrieved Memory ≠ Current Prediction

117. Autonomous Agent Re-Entry

An autonomous agent may reactivate a historical prediction when similar conditions recur.

PRRM should prevent automatic reuse from silently resetting history or probability.

118. Similar Conditions ≠ Same Prediction by Default

119. Periodic Prediction Re-Entry

Recurring predictions may need clear separation between:

historical cycle

and:

new cycle.

120. Recurring Event ≠ Same Prediction Object by Default

Example:

Prediction of:

2026 annual demand

and:

2027 annual demand

may belong to related methodology lineage but distinct Prediction Objects.

121. Re-Entry Qualification

Possible qualifications include:

Historical Context Changed

Methodology Updated

Prediction Basis Refreshed

Original Outcome Known

Performance History Available

Model Replaced

Purpose Changed

Analytical Use Only

New Horizon Applied

122. Re-Entry Continuity State

Possible states:

Continuity Preserved

Continuity Preserved with Qualification

Derived Continuity

Historical Reference Only

New Prediction Required

Continuity Disputed

Unable to Determine

123. Re-Entry Legitimacy State

Possible determinations:

Re-Entry Supported

Re-Entry Supported with Qualification

Analytical Reuse Supported

Operational Re-Entry Restricted

New Prediction Formation Required

Re-Entry Not Supported

Unable to Determine

124. Re-Entry Traceability

A governed re-entry should support reconstruction of:

original Prediction Record; last lifecycle state; inactive period; re-entry trigger; re-entry purpose; context changes; current methodology; current Prediction Basis; resulting classification; resulting state.

125. Re-Entry Record

PRRM should create a distinct Re-Entry Record rather than overwrite the original origin metadata.

126. Re-Entry History

A Prediction Record may re-enter more than once.

Example:

Active → Retired → Re-Entered → Archived → Re-Entered

Each re-entry should remain historically identifiable.

127. Multiple Re-Entries

Multiple re-entry events should not reset prior re-entry history.

128. Re-Entry Count

Where material, systems may preserve how many times a Prediction Record has re-entered governed use.

129. Re-Entry Integrity

Re-entry should be protected against:

origin resetting; deletion of prior failure; deletion of withdrawal; probability carryover without basis; methodology substitution; performance reset; context erasure; duplicate record creation; false contemporaneous representation.

130. False Freshness

A historical prediction must not appear newly formed merely because it has been republished or imported.

131. Fresh Publication ≠ Fresh Prediction

132. Historical Success Marketing Risk

A successful historical prediction may be republished as evidence of current capability.

PRRM should preserve that the prediction belongs to a historical context.

133. Historical Performance ≠ Current Capability by Default

134. Re-Entry Auditability

PRRM should support later determination of:

Why was this Prediction Record returned to use?

Who authorized it?

What changed since original use?

Was it still the same prediction?

Was a new probability formed?

Was prior outcome known?

Did performance history already exist?

135. Machine-Readable Re-Entry

Machine-readable systems should support explicit fields for:

original record ID; original origin; prior lifecycle state; re-entry timestamp; re-entry purpose; context change; classification; re-entry legitimacy; continuity state.

136. Automated Same-vs-New Classification

Systems may assist in determining whether re-entry should be:

same prediction

derived prediction

or:

new prediction.

Final governance logic should remain explicit.

137. Re-Entry Control Rule

A useful machine control is:

Do not reactivate historical probability or predictive status without current applicability assessment.

138. Historical Context Preservation Rule

Another control is:

Always expose original origin when a historical Prediction Record re-enters use.

139. Performance Preservation Rule

Do not reset or detach historical Predictive Performance during re-entry.

140. Outcome-Known Rule

Do not represent a resolved historical prediction as a live prediction of the same already-known outcome.

141. Governance Requirements

A governed PRRM implementation should be able to:

1. identify Prediction Record Re-Entry; 2. preserve Re-Entry Trigger; 3. preserve Re-Entry Purpose; 4. determine Re-Entry Eligibility; 5. classify Re-Entry Eligibility State; 6. preserve Historical Identity Continuity; 7. determine same Prediction Lineage; 8. distinguish same Prediction from same current meaning; 9. identify New Prediction Boundary; 10. identify Derived Prediction; 11. distinguish Derived Prediction from re-entered original; 12. distinguish reused methodology from reused Prediction Record; 13. classify Re-Entry; 14. preserve Re-Entry Authority; 15. support Automated Re-Entry Candidate identification; 16. distinguish automated candidate from governed re-entry; 17. preserve Human Re-Entry Decision where applicable; 18. support Hybrid Re-Entry; 19. preserve Re-Entry Timestamp; 20. distinguish Original Origin from Re-Entry Time; 21. prevent re-entry from resetting origin; 22. govern Archive Re-Entry; 23. govern Retirement Re-Entry; 24. govern Withdrawal Re-Entry; 25. preserve prior withdrawal; 26. distinguish Reinstatement from Re-Entry; 27. preserve Lifecycle Gap; 28. distinguish lifecycle gap from Historical Gap; 29. perform Re-Entry Context Assessment; 30. classify Context Change; 31. determine Context Continuity; 32. identify Context Drift; 33. distinguish same event type from same predictive context; 34. assess Prediction Object Continuity; 35. identify Object Transformation; 36. assess Predictive Purpose Continuity; 37. identify New Purpose Boundary; 38. reassess Prediction Horizon; 39. identify Expired Horizon; 40. govern New Horizon; 41. prevent Horizon Reset from erasing history; 42. reassess Predictive Boundary; 43. reassess geographic context; 44. reassess population context; 45. reassess Methodology; 46. determine Methodology Applicability;
47. identify Methodology Obsolescence; 48. distinguish historical validity from current applicability; 49. preserve Methodology Upgrade; 50. reassess Model; 51. identify Retired Model; 52. preserve Model Upgrade history; 53. reassess Prediction Basis; 54. distinguish Historical from Current Prediction Basis; 55. support Basis Refresh; 56. identify Stale Basis; 57. distinguish historical integrity from current predictive sufficiency; 58. reassess assumptions; 59. identify Expired Assumptions; 60. preserve Assumption Drift; 61. govern Conditional Prediction Re-Entry; 62. reassess probability; 63. distinguish Historical from Current Probability; 64. prevent Probability Carryover without basis; 65. reassess uncertainty; 66. reassess confidence; 67. detect Outcome-Known Re-Entry; 68. prevent known outcomes from being represented as new predictions of the same event; 69. support historical outcome reuse; 70. distinguish operational from analytical reuse; 71. preserve Performance-Known Re-Entry; 72. prevent Performance Reset; 73. support historical failure reuse; 74. support historical success reuse; 75. distinguish historical success from current validity; 76. preserve Performance Context Continuity; 77. distinguish Historical Reference from Current Decision Prediction; 78. govern Communication Re-Entry; 79. prevent republishing from becoming new Prediction Formation; 80. distinguish Publication Date from Prediction Date; 81. preserve PCRS Reliance Boundary; 82. distinguish Re-Entry from Reliance Eligibility; 83. support Cross-System Re-Entry; 84. preserve original identity across system change; 85. preserve Migration Continuity; 86. support Legacy System Recovery; 87. distinguish Recovery Time from Origin Time; 88. detect Duplicate Origin Risk; 89. distinguish Duplicate Re-Entry from independent prediction; 90. preserve Canonical Record Reference where applicable; 91. preserve conflicting historical copies; 92. identify Re-Entry Conflict; 93. prevent conflict from merging histories silently; 94. preserve Derived Prediction Lineage; 95. support New Origin with Historical Lineage; 96. distinguish New Origin from no historical relationship; 97. support Scenario Reuse; 98. distinguish Scenario Similarity from Prediction Identity; 99. support Benchmarking Reuse; 100. distinguish Benchmarking from Operational Re-Entry; 101. support Simulation Reuse; 102. distinguish Simulation Use from Prediction Reactivation; 103. support Training-Data Reuse; 104. distinguish training data from active prediction population; 105. support AI Memory Re-Entry; 106. distinguish retrieved memory from current prediction; 107. support Autonomous Agent Re-Entry; 108. distinguish similar

conditions from same prediction; 109. govern Periodic Prediction Re-Entry; 110. distinguish recurring event from same Prediction Object; 111. preserve Re-Entry Qualification;

112. determine Re-Entry Continuity State; 113. determine Re-Entry Legitimacy State; 114. preserve Re-Entry Traceability; 115. create distinct Re-Entry Record; 116. preserve multiple Re-Entry history; 117. preserve Re-Entry Count where material; 118. preserve Re-Entry Integrity; 119. prevent False Freshness; 120. distinguish Fresh Publication from Fresh Prediction; 121. identify Historical Success Marketing Risk; 122. distinguish historical performance from current capability; 123. support Re-Entry Auditability; 124. support Machine-Readable Re-Entry; 125. support automated same-vs-new classification; 126. prevent historical probability reactivation without current assessment; 127. preserve Original Origin; 128. preserve Historical Performance; 129. enforce Outcome-Known boundary; 130. preserve complete re-entry lineage; 131. produce a Governed Prediction Record Re-Entry Determination.

142. Governance Logic

PRRM applies the following operational logic:

Has a historically existing Prediction Record returned or been proposed for return to use?

If no:

→ Re-Entry governance does not apply.

If yes:

→ identify Original Prediction Record.

What was the last governed lifecycle state?

→ Active;

→ Withdrawn;

→ Retired;

→ Archived;

→ Suspended;

→ another state.

What is the purpose of return?

→ operational prediction;

→ analytical reuse;

→ benchmarking;

→ research;

→ simulation;

→ training;

→ decision support.

Does the original Prediction Object remain materially continuous?

If no:

→ New Prediction Formation may be required.

If yes:

→ continue.

Has the predictive purpose materially changed?

If yes:

→ assess whether same-lineage re-entry remains legitimate.

Has the Prediction Horizon expired?

If yes:

→ do not silently reset it.

Has Predictive Boundary changed?

If yes:

→ preserve change and assess continuity.

Is the historical methodology still applicable?

If no:

→ methodology refresh or new prediction formation may be required.

Is the historical Prediction Basis still current?

If no:

→ refresh basis.

Do not reuse stale basis as current basis.

Do historical assumptions still hold?

If no:

→ reassess predictive meaning.

Is historical probability being reused?

If yes:

→ require current applicability.

Is the original outcome already known?

If yes:

→ the same resolved event cannot be represented as a new live prediction.

Does historical Predictive Performance already exist?

If yes:

→ preserve it.

Do not reset performance history.

Is the record being imported or restored from another system?

If yes:

→ preserve original origin and lineage.

Does an existing canonical Prediction Record already represent this historical prediction?

If yes:

→ link rather than create false new origin.

Then classify:

Same Prediction Re-Entry

or:

Same Lineage, New Version

or:

Derived Prediction

or:

Historical Reference Only

or:

New Prediction Required

Then:

- establish Re-Entry Timestamp;
- preserve Original Origin;
- preserve Re-Entry Purpose;
- preserve Context Changes;
- determine Re-Entry Continuity State;
- determine Re-Entry Legitimacy State;
- create Re-Entry Record;
- preserve complete lineage.

Canonical transition:

Historical Prediction Record → Re-Entry Assessment → Identity / Context / Methodology / Basis Evaluation
→ Re-Entry Classification → Governed Re-Entry State

143. Minimum Implementation Framework

A. Original Prediction Record ID

Persistent reference to the historical Prediction Record.

B. Original Origin

Original Prediction Record formation and historical origin reference.

C. Last Lifecycle State

Withdrawn, Retired, Archived, Suspended, or other applicable state before re-entry.

D. Re-Entry ID

Unique identifier for the re-entry event.

E. Re-Entry Timestamp

Time the Prediction Record returns to governed consideration or use.

F. Re-Entry Trigger

Event or condition causing historical prediction reuse.

G. Re-Entry Purpose

Operational, analytical, benchmarking, research, simulation, training, or other governed purpose.

H. Identity & Lineage Assessment

Same Prediction, same lineage/new version, derived prediction, historical reference, or new prediction.

I. Context Change Assessment

Material changes in time, geography, market, regulation, infrastructure, organization, decision context, or environment.

J. Methodology / Model Assessment

Historical and current methodology/model applicability.

K. Basis / Assumption Assessment

Historical vs current Prediction Basis and assumptions.

L. Horizon / Boundary Assessment

Historical and current Prediction Horizon and Predictive Boundary.

M. Outcome / Performance Context

Whether original outcome and Predictive Performance are known and preserved.

N. Re-Entry Qualification & Legitimacy

Applicable restrictions, qualifications, and Re-Entry Legitimacy State.

O. Re-Entry Continuity Record

Original identity, historical lineage, inactive period, re-entry event, resulting state, and complete traceability.

144. Governance Outputs

PRRM may produce:

Governed Prediction Record Re-Entry Determination Re-Entry ID

Original Prediction Record Reference Original Origin Reference Last Lifecycle State Re-Entry Trigger Re-Entry Purpose Re-Entry Timestamp Re-Entry Authority Prediction Object Continuity Assessment Predictive Purpose Continuity Assessment Context Change Assessment Methodology Applicability Assessment Model Applicability Assessment Prediction Basis Refresh State Assumption Reassessment State Prediction Horizon Reassessment Predictive Boundary Reassessment Historical Probability Qualification Outcome-Known Re-Entry Indicator Historical Performance Reference Same Prediction Re-Entry Classification Same Lineage / New Version Classification Derived Prediction Classification Historical Reference Classification New Prediction Required Determination Re-Entry Qualification Re-Entry Continuity State Re-Entry Legitimacy State Duplicate Origin Indicator Re-Entry Lineage Record Re-Entry Traceability Record

The primary output is:

Governed Prediction Record Re-Entry Determination

This closes the operational module flow of:

PRCS — Prediction Record & Continuity Standard

145. Critical Distinctions

Re-Entry ≠ New Origin by Default

Historical Reuse ≠ Operational Revalidation

Same Prediction ≠ Same Current Meaning

Derived Prediction ≠ Re-Entered Original Prediction

Reused Methodology ≠ Reused Prediction

Reused Prediction Template ≠ Same Prediction Identity

Automated Candidate ≠ Governed Re-Entry

Original Record Origin ≠ Re-Entry Timestamp
Re-Entry After Withdrawal ≠ Withdrawal Never Happened
Reinstatement ≠ Re-Entry by Default
Lifecycle Gap ≠ Missing History
Same Event Type ≠ Same Predictive Context
Purpose Change ≠ Automatic Continuity
Horizon Reset ≠ Historical Horizon Erasure
Historical Validity ≠ Current Applicability
Historical Prediction Basis ≠ Current Prediction Basis
Historical Integrity ≠ Current Predictive Sufficiency
Historical Probability ≠ Current Probability
Known Outcome ≠ New Prediction
Re-Entry ≠ Performance Reset
Historical Success ≠ Current Predictive Validity
Historical Reference ≠ Current Decision Prediction
Republishing ≠ New Prediction Formation
Re-Entry ≠ Reliance Eligibility
System Change ≠ Prediction Origin Change
Recovery Timestamp ≠ Prediction Origin Timestamp
Duplicate Re-Entry ≠ New Independent Prediction
New Origin ≠ No Historical Relationship
Scenario Similarity ≠ Prediction Identity
Benchmarking ≠ Operational Re-Entry
Simulation Use ≠ Prediction Reactivation
Training Data ≠ Active Prediction Population
Retrieved Memory ≠ Current Prediction
Similar Conditions ≠ Same Prediction by Default
Recurring Event ≠ Same Prediction Object by Default
Fresh Publication ≠ Fresh Prediction
Historical Performance ≠ Current Capability by Default

146. Enterprise Application

PRRM can govern historical Prediction Record re-entry across:

AI forecasting systems; enterprise forecasting; financial forecasting; investment research; prediction markets; insurance; industrial forecasting; predictive maintenance; infrastructure; supply-chain forecasting; energy forecasting;

technology forecasting; public-sector forecasting; geopolitical forecasting; autonomous agents; Human-AI systems; model archives; historical benchmark datasets; predictive registries; multi-agent systems.

Its function remains constant:

allow historically existing predictions to become relevant again without allowing reuse to erase origin, reset performance, inherit stale probability, hide prior withdrawal, or falsely create a new predictive history.

147. Use Case 1 — A Five-Year-Old AI Prediction Returns After Similar Market Conditions Reappear

In 2027, an AI system predicts:

"There is a 68% probability that a major liquidity contraction will occur within 12 months."

The event does not occur within the original Prediction Horizon.

The prediction is later:

Retired → Archived

Its performance history remains preserved.

In 2032, similar market conditions appear.

An automated system retrieves the historical Prediction Record and proposes:

"68% probability of liquidity contraction."

The critical governance question is:

Can the old 68% prediction simply be reactivated because the market appears similar?

PRRM answers:

No.

The historical prediction may legitimately re-enter as:

Historical Reference

or:

Methodological Input

but current operational use requires reassessment of:

Prediction Object; current Prediction Horizon; current Prediction Basis; assumptions; methodology; market context; probability;

uncertainty.

The historical record remains:

Original Prediction — 2027

with its original performance.

If a new governed prediction is formed in 2032, it may preserve historical lineage to the earlier Prediction Record.

But:

Historical Probability ≠ Current Probability

Similar Conditions ≠ Same Prediction by Default

Historical Performance ≠ Current Capability by Default

148. Use Case 2 — A Withdrawn Industrial Failure Prediction Becomes Relevant Again After the Asset Is Rebuilt

An industrial AI system predicts:

75% probability of structural failure in Asset A within six months.

The operator removes the asset from service before failure occurs.

The prediction is:

Active → Withdrawn

and later:

Archived

Three years later, Asset A undergoes major reconstruction and returns to service.

The historical Prediction Record is retrieved because engineers want to know whether the prior risk remains relevant.

The critical governance question is:

Is this the same prediction returning, a derived prediction based on historical risk, or a completely new prediction?

PRRM evaluates:

Asset identity continuity; structural modifications; new sensor configuration; new operating conditions; new methodology; new Prediction Basis; original Prediction Horizon; prior intervention; original withdrawal history; prior Predictive Performance status.

Because the asset has been materially rebuilt and the original six-month horizon expired years earlier, PRRM may determine:

Historical Reference Only

followed by:

New Prediction Formation Required

The new prediction may preserve lineage:

Historical Prediction P1 → New Derived Prediction P2

But P2 must not inherit:

75% probability

simply because P1 carried that value.

The original withdrawal remains historical.

The intervention remains historical.

The original record remains reconstructable.

Re-Entry After Withdrawal ≠ Withdrawal Never Happened

New Prediction ≠ Historical Erasure

Historical Risk Signal ≠ Current Probability

149. Canonical Boundary

PRRM governs the legitimate return, reuse, reactivation, derivation, historical referencing, or reclassification of a historically existing Governed Prediction Record after meaningful lifecycle exit, archival, retirement, withdrawal, extended inactivity, migration, recovery, or changed operational context. It determines whether continuity supports same-prediction re-entry, same-lineage versioning, derived prediction formation, historical reference only, analytical reuse, or formation of a new Prediction Record. It

preserves original origin, lineage, lifecycle history, historical methodology, Prediction Basis, assumptions, probability, outcome, Predictive Performance, withdrawal, retirement, archival status, and other material historical conditions while preventing stale probability, false freshness, duplicate origin, performance reset, or historical erasure. It does not independently create a new prediction, validate current predictive quality, establish Operational Reality, determine Predictive Performance, or establish reliance legitimacy.

PRFM owns:

Prediction Record Formation

PVCM owns:

Prediction Version Continuity

PHPM owns:

Prediction History Preservation

PRSTM owns:

Prediction Record State Transition

PRRM owns:

Prediction Record Re-Entry

150. Canonical Closing Statement

A prediction may leave active use and still remain part of governed history. It may later become relevant again, but relevance does not reset origin, probability, methodology, performance, or past failure.

PRRM allows Prediction Records to return without pretending they are historically new and allows genuinely new predictions to inherit lineage without inheriting false continuity.

A prediction may return to the lifecycle. Its history must return with it.

It
