Canonical Language:

English (UCL™)

Governed Space

PRSTM governs how a Governed Prediction Record moves from one lifecycle state to another while preserving state identity, transition authority, transition reason, temporal ordering, prior-state visibility, historical continuity, and downstream interpretability.

It governs the transition:

Current Prediction Record State → Governed State Transition → New Prediction Record State

Its foundational principle is:

A change in Prediction Record status must change the present state without erasing the state that existed before it.

Canonical Definition

The Prediction Record State Transition Module (PRSTM) defines the operational governance requirements by which a Governed Prediction Record changes lifecycle status while maintaining historical continuity, traceability, state provenance, temporal sequence, and reconstructability.

PRSTM governs:

State Identification; State Eligibility; Transition Eligibility; Transition Trigger; Transition Authority; Transition Reason; Transition Timestamp; Effective Transition Time; Prior State; New State; transition qualification; Active State; Review State; Superseded State; Withdrawn State; Suspended State; Retired State; Archived State;

Disputed State; Invalidated Record State where governance establishes it; reinstatement transitions; rollback transitions; terminal and non-terminal states; state conflict; state transition history; state continuity; downstream status signaling.

Its primary output is:

Governed Prediction Record State Transition

Operational Role

PRSTM is the fourth operational module within PRCS.

Its focused operational question is:

When the lifecycle status of a Prediction Record changes, how must that transition be governed so that the new state becomes operationally clear without destroying the historical meaning of the prior state?

PRSTM does not decide whether the predictive content should change.

PMRS governs monitoring, review, revision, supersession, and withdrawal of predictions.

PRSTM governs the resulting lifecycle state transition of the Prediction Record itself.

Record State Transition $\neq$ Prediction Revision

Internal Module Flow

Prediction Record Formation → Prediction Version Continuity → Prediction History Preservation → Prediction Record State Transition → Prediction Record Re-Entry

Current Position:

Prediction Record State Transition

1. Prediction Record State

A Prediction Record State represents the current lifecycle condition of a Governed Prediction Record.

Possible states may include:

Formed

Active

Under Review

Restricted

Suspended

Superseded

Withdrawn

Retired

Archived

Disputed

Reinstated

Re-Entered

The exact implementation taxonomy may vary.

The governance meaning must remain explicit.

2. State ≠ Version

A Prediction Version represents a material predictive state.

A Prediction Record State represents lifecycle status.

Example:

A prediction version may remain unchanged while its record moves:

Active → Under Review → Active

Therefore:

Prediction Version ≠ Prediction Record State

3. State Transition

A State Transition occurs when the Prediction Record moves from one lifecycle condition to another.

Conceptually:

State A → Governed Transition → State B

4. Prior State

Every governed transition should preserve the applicable prior state.

5. New State

Every governed transition should identify the resulting new state.

6. Transition Identity

A material state transition should itself remain historically identifiable.

7. Transition Eligibility

Not every requested status change is automatically legitimate.

Transition eligibility may depend on:

current state; triggering event; authority; applicable governance conditions; unresolved conflicts; required review.

8. State Transition Matrix

Implementations may define permissible transitions.

Example:

Active → Under Review

Under Review → Active

Under Review → Revised

Active → Withdrawn

Superseded → Archived

Not all state-to-state movements need to be permissible.

9. Invalid Transition

A requested transition may be classified as:

Transition Not Permitted

where the state relationship violates applicable governance logic.

10. Transition Trigger

Every material transition should be attributable to an identifiable trigger where available.

Examples:

prediction review; revision; supersession; withdrawal; expiry; dispute; system migration; archival policy; reinstatement; compliance event; outcome resolution; lifecycle closure.

11. Transition Reason

The trigger explains what initiated the transition.

The Transition Reason explains why the state changed.

These may differ.

12. Trigger ≠ Reason

Example:

Trigger: New contradictory information received

Reason: Prediction entered formal review

13. Transition Authority

Where lifecycle state changes require authority, PRSTM should preserve who or what was authorized to initiate or approve the transition.

14. Authority Types

Transition Authority may originate from:

human owner; governance process; forecasting platform; automated control; authorized model process; organizational policy; system rule; external authority where applicable.

15. Authority Boundary

PRSTM records transition authority.

It does not independently create legal authority.

16. Transition Timestamp

A governed transition should preserve when it was recorded.

17. Effective Transition Time

Transition recording time may differ from operational effective time.

Where material:

Transition Timestamp ≠ Effective Transition Time

18. State Sequence

State transitions should remain chronologically connected.

Example:

Formed → Active → Under Review → Superseded → Archived

19. State Sequence Integrity

A later state must not be retrospectively inserted as though it existed earlier without qualification.

20. Active State

Active indicates that the Prediction Record currently represents a live governed predictive state.

Active status does not establish:

predictive quality; reliability; validity; decision authority.

21. Active ≠ Validated

A prediction may be active without having undergone independent validation.

22. Active ≠ Reliance-Eligible

PCRS governs reliance.

A prediction being active does not automatically mean it may be operationally relied upon.

23. Under Review State

A Prediction Record may enter:

Under Review

when material conditions require governance review.

24. Under Review ≠ Withdrawn

A prediction under review may remain operationally visible while its status is being reassessed.

25. Review Restriction

An implementation may apply:

Reliance Restricted

or another status while review is underway.

PCRS owns reliance legitimacy.

PRSTM preserves the lifecycle state.

26. Restricted State

A Prediction Record may be active but subject to operational restrictions.

Examples:

limited audience; no automated execution; no external publication; qualified reliance only.

27. Restricted ≠ Inactive

A restricted record may remain active.

28. Suspended State

Suspension may temporarily stop active predictive use without permanently closing the Prediction Record.

29. Suspension ≠ Withdrawal

Suspension may be temporary.

Withdrawal may end active predictive status more decisively.

30. Suspension Continuity

A suspended record retains its complete history and identity.

31. Superseded State

A Prediction Record or Prediction Version may become superseded when a newer governed state replaces it operationally.

32. Superseded ≠ Deleted

The superseded state remains historical.

33. Superseding Reference

A superseded record state should identify the state or version that superseded it where applicable.

34. Supersession Time

The time at which supersession became effective should remain identifiable.

35. Withdrawal State

Withdrawal means that a prediction is no longer presented as an active predictive state.

36. Withdrawal ≠ Deletion

Withdrawal must preserve historical existence.

37. Withdrawal ≠ Prediction Failure

A prediction may be withdrawn because:

conditions changed; methodology became unsuitable; Prediction Basis deteriorated; scope ceased to exist; governance requirements were no longer satisfied.

Withdrawal does not by itself establish incorrectness.

38. Withdrawal Reason

Where available, Withdrawal Reason should remain preserved.

39. Withdrawal Time

Withdrawal should be temporally anchored.

40. Post-Withdrawal History

Outcome and performance records may still later become associated with a withdrawn prediction.

Withdrawal does not end historical governance.

41. Retired State

Retirement indicates that the Prediction Record is no longer expected to return to ordinary operational use under its current lifecycle.

42. Retirement ≠ Erasure

Retired records remain historically reconstructable.

43. Retirement Reason

Possible reasons include:

completed lifecycle; expired predictive relevance; retired model; retired methodology; discontinued product; system decommissioning.

44. Retirement vs Withdrawal

Withdrawal concerns ending active predictive status.

Retirement may represent broader lifecycle closure.

Withdrawal ≠ Retirement

45. Archived State

Archive status represents historical preservation outside ordinary active operations.

46. Archive ≠ Delete

A record may be archived precisely because its historical value remains important.

47. Archive Transition

The archive event should preserve:

prior state; archive time; archive reason; archive reference where appropriate.

48. Archived Record Accessibility

Archive status does not necessarily imply public accessibility.

Access governance remains separate.

49. Disputed State

A Prediction Record may become disputed where material disagreement exists concerning:

prediction content; version sequence; timestamp; provenance; authority; outcome association; record integrity.

50. Disputed ≠ Invalid

A disputed record may remain historically valid while specific aspects remain contested.

51. Dispute Scope

The record should identify what exactly is disputed.

52. Partial Dispute

Only one component of a Prediction Record may be disputed.

Example:

Timestamp disputed

while:

Prediction content undisputed

53. Invalidated Record State

Where an appropriate governance process establishes that a record should not be treated as a valid governed predictive state, an implementation may use:

Invalidated

or equivalent.

This must not mean deletion.

54. Invalidated ≠ Nonexistent

An invalidated Prediction Record may remain historically important.

55. Invalidity Scope

The scope of invalidity should remain explicit.

Examples:

record integrity invalid; prediction provenance invalid; methodology status invalid; timestamp unreliable.

56. Terminal State

A Terminal State is a lifecycle condition from which normal predictive operation is not expected to continue.

Examples may include:

Retired

Archived

Certain implementations may treat Withdrawn as terminal.

57. Terminal ≠ Irreversible by Definition

Some terminal states may later support governed re-entry.

PRRM owns re-entry governance.

58. Non-Terminal State

Non-terminal states may allow ordinary lifecycle continuation.

Examples:

Active

Under Review

Restricted

Suspended

59. Transition Reversibility

Some transitions may be reversible.

Example:

Active → Suspended → Active

Others may require special governance.

60. Reinstatement

Reinstatement returns a record from a non-active state to an active or eligible state.

61. Reinstatement ≠ Re-Entry by Default

Simple reinstatement inside the same continuing lifecycle may remain a state transition.

PRRM governs more substantive lifecycle re-entry.

62. Rollback Transition

Where a state was changed incorrectly or temporarily, governance may return to a prior lifecycle state.

63. Rollback ≠ History Erasure

Both the incorrect or temporary state and rollback event should remain historically visible.

64. Emergency Transition

A system may require expedited status transition.

Examples:

Active → Suspended

because of:

corrupted input; model failure; security issue; integrity concern; dangerous reliance condition.

65. Emergency ≠ Governance-Free

Emergency transitions should still preserve:

trigger; authority; time; reason; resulting state.

66. Automated Transition

Some systems may automatically transition states based on governance rules.

Example:

Prediction Horizon Expired → Retired

67. Automated Transition Authority

The rule or system performing an automated transition should remain identifiable.

68. Human Transition

Human-authorized lifecycle transitions should preserve applicable actor or authority references.

69. Hybrid Transition

A machine may trigger a state change requiring human approval.

Both roles should remain visible.

70. State Conflict

Different systems may report conflicting current states.

Example:

System A: Active

System B: Withdrawn

PRSTM should preserve the conflict.

71. State Conflict ≠ Silent Reconciliation

72. Canonical Current State

An implementation may establish one state as the canonical operational current state.

The basis for that designation should remain traceable.

73. Canonical State ≠ Complete State History

74. State Conflict Resolution

A governed process may reconcile competing states.

The conflict and resolution should both remain historical events.

75. Transition Qualification

Transitions may carry qualifications.

Examples:

Temporary

Conditional

Emergency

Disputed

Automated

Retrospective

Pending Confirmation

76. Conditional Transition

A state change may depend upon conditions.

Example:

Suspended pending methodology review

77. Temporary Transition

A temporary state should preserve expected or actual termination conditions where applicable.

78. Transition Pending

A proposed transition may remain pending until required governance conditions are satisfied.

79. Pending ≠ Effective

A requested transition should not be represented as effective before governance requirements are satisfied.

80. Transition Failure

A proposed transition may fail.

Examples:

insufficient authority; invalid source state; missing required evidence; incompatible target state.

81. Failed Transition History

Material failed transition attempts may themselves need historical preservation.

82. Transition Cancellation

A pending transition may be cancelled.

The cancellation should remain distinguishable from successful transition.

83. State Metadata

Each lifecycle state may preserve:

state identifier; effective time; authority; reason; qualification; predecessor state; successor state where known.

84. State History

State History is the ordered record of all material Prediction Record states.

Example:

Formed → Active → Under Review → Active → Superseded → Archived

85. State History ≠ Version History

A single Prediction Version can move through several lifecycle states.

86. State and Version Relationship

Each material lifecycle state should remain linkable to the applicable Prediction Version.

87. State and Communication

The record state may affect how the prediction may be communicated.

PCRS owns communication governance.

PRSTM provides current lifecycle-state context.

88. State and Reliance

Reliance decisions may depend on whether the Prediction Record is:

Active; Under Review; Restricted; Withdrawn; Superseded.

PCRS determines reliance legitimacy.

89. State and Performance

Performance history should preserve which lifecycle state applied when outcome comparison occurred.

A withdrawn or superseded prediction may still remain performance-assessable.

90. Withdrawn ≠ Performance-Ineligible

91. Superseded ≠ Performance-Ineligible

92. State and Outcome

Outcome association does not automatically reactivate a prediction.

A record can remain:

Withdrawn

while later becoming:

Outcome-Associated

93. Lifecycle Status vs Analytical Status

Operational lifecycle state and analytical state may coexist.

Example:

Lifecycle State: Archived

Performance State: Performance Assessable

These should not be collapsed.

94. Status Multiplicity

Prediction governance may require several orthogonal statuses.

PRSTM governs lifecycle status.

Other PGA standards may govern:

feasibility status; reliance status; performance status; outcome comparison status.

95. Lifecycle State $\neq$ Predictive Quality

A Prediction Record being Active, Withdrawn, or Archived does not directly establish predictive quality.

96. Historical Status Preservation

Every material past lifecycle state should remain reconstructable.

97. Current-State Replacement Risk

Systems often store only one field:

status = active

When later changed to:

status = withdrawn

the prior state may disappear.

PRSTM requires historical state-transition preservation.

98. State Event Record

A state transition should be preserved as an event rather than only a mutable current-value field.

99. Append State History

Conceptually:

State History + New Transition Event $\rightarrow$ Updated State History

rather than:

Old State overwritten by New State

100. State Transition Provenance

Each material transition should preserve sufficient provenance.

101. Transition Actor

Where applicable, preserve the actor or system initiating the transition.

102. Transition Approver

Where approval is required, initiator and approver may differ.

103. Initiator ≠ Approver

104. Transition Evidence Reference

Where required, a transition may reference supporting governance evidence.

ADIT® may govern broader evidence structures.

105. Transition Integrity

State transitions should be protected against:

unauthorized state change; backdating; deletion; sequence rewriting; unexplained status changes; unsupported reactivation.

106. Backdated State Transition

Where a transition is recorded after its claimed effective time, both should remain visible.

107. Retrospective Transition

A state transition reconstructed later should remain qualified as retrospective where appropriate.

108. Retrospective Transition ≠ Contemporaneous Transition

109. Cross-System State Transition

Prediction Records may move between systems with different state taxonomies.

Semantic mapping should preserve lifecycle meaning.

110. State Mapping

Example:

System A:

Inactive

System B:

Retired

A migration should not assume equivalence unless governance establishes it.

111. Same Label ≠ Same State Meaning

112. State Interoperability

Machine-readable state governance should preserve both:

state label; state semantics.

113. Machine-Readable Transition

A machine-readable transition should support questions such as:

What was the record state at time T?

When did it become withdrawn?

Who authorized the transition?

Which state preceded archival?

Was reinstatement legitimate?

114. Automated Transition Validation

Systems may automatically verify:

source state; target state; authority; required conditions; transition order.

115. Forbidden Transition Detection

Example:

Archived → Active

may require PRRM re-entry rather than ordinary state transition.

The system should detect this boundary.

116. Re-Entry Boundary

Where lifecycle return requires substantive reconstruction or new governance qualification, PRRM takes ownership.

117. Reinstatement vs Re-Entry

Reinstatement may restore a temporarily inactive record inside the same continuous lifecycle.

Re-Entry governs a prediction returning after meaningful lifecycle exit, archival, retirement, or changed operational context.

118. State Continuity

State Continuity exists where each material lifecycle state and transition remains connected.

119. State Continuity State

Possible states:

State Continuity Established

State Continuity Established with Qualification

Partial State Continuity

State Conflict Present

State History Incomplete

State Continuity Not Established

Unable to Determine

120. Transition Legitimacy State

Possible transition determinations:

Transition Supported

Transition Supported with Qualification

Transition Pending

Transition Restricted

Transition Not Supported

Unable to Determine

121. Governance Requirements

A governed PRSTM implementation should be able to:

1. identify current Prediction Record State; 2. distinguish Prediction Version from Prediction Record State;
3. identify Prior State; 4. identify New State; 5. establish Transition Identity; 6. determine Transition Eligibility; 7. support State Transition Matrix logic; 8. identify invalid transitions; 9. preserve Transition Trigger; 10. preserve Transition Reason; 11. distinguish Trigger from Reason; 12. preserve Transition Authority; 13. preserve applicable authority type; 14. preserve Transition Timestamp; 15. preserve Effective Transition Time; 16. preserve State Sequence; 17. preserve State Sequence Integrity; 18. govern Active State; 19. distinguish Active from Validated; 20. distinguish Active from Reliance-Eligible; 21. govern Under Review State; 22. distinguish Under Review from Withdrawn; 23. govern Restricted State; 24. distinguish Restricted from Inactive; 25. govern Suspended State; 26. distinguish Suspension from Withdrawal; 27. preserve Suspension Continuity; 28. govern Superseded State; 29. prevent supersession from causing deletion; 30. preserve Superseding Reference; 31. preserve Supersession Time; 32. govern Withdrawal State; 33. prevent withdrawal from causing deletion; 34. distinguish Withdrawal from Prediction Failure; 35. preserve Withdrawal Reason;
36. preserve Withdrawal Time; 37. preserve Post-Withdrawal History; 38. govern Retired State; 39. prevent retirement from causing erasure; 40. preserve Retirement Reason; 41. distinguish Withdrawal from Retirement; 42. govern Archived State; 43. preserve Archive Transition; 44. preserve archival accessibility boundary; 45. govern Disputed State; 46. distinguish Disputed from Invalid; 47. preserve Dispute Scope; 48. support Partial Dispute; 49. support Invalidated Record State where legitimately established; 50. prevent invalidation from causing historical disappearance; 51. preserve Invalidity Scope; 52. distinguish Terminal from Non-Terminal States; 53. preserve re-entry boundary; 54. govern Transition Reversibility; 55. support Reinstatement; 56. distinguish Reinstatement from Re-Entry; 57. support Rollback Transition; 58. prevent Rollback from erasing history; 59. support Emergency Transition; 60. preserve emergency trigger, authority, time, and reason; 61. support Automated Transition; 62. preserve automated transition authority; 63. support Human Transition; 64. support Hybrid Transition; 65. identify State Conflict; 66. prevent silent reconciliation; 67. support Canonical Current State designation; 68. preserve complete state history; 69. preserve conflict-resolution history; 70. preserve Transition Qualification; 71. govern Conditional Transition; 72. govern Temporary Transition; 73. govern Transition Pending state; 74. distinguish Pending from Effective; 75. identify Transition Failure; 76. preserve material Failed Transition History; 77. preserve Transition Cancellation; 78. preserve State Metadata; 79. preserve State History; 80. distinguish State History from Version History; 81. preserve State-Version relationship; 82. preserve Communication-state boundary; 83. preserve Reliance-state boundary; 84. preserve Performance-state relationship; 85. distinguish Withdrawn from Performance-Ineligible; 86. distinguish Superseded from Performance-Ineligible; 87. preserve Outcome-state relationship; 88. distinguish Lifecycle Status from Analytical Status; 89. support Status Multiplicity; 90. distinguish Lifecycle State from Predictive Quality; 91. preserve Historical Status; 92. prevent Current-State Replacement; 93. preserve State Event Records; 94. support append-state history; 95. preserve State Transition Provenance; 96. preserve Transition Actor; 97. preserve Transition Approver where applicable; 98. distinguish Initiator from Approver; 99. preserve Transition Evidence Reference where applicable; 100. preserve Transition Integrity;

101. identify Backdated State Transitions; 102. identify Retrospective Transitions; 103. distinguish retrospective from contemporaneous transitions; 104. support Cross-System State Transition; 105. preserve semantic State Mapping; 106. distinguish same label from same meaning; 107. support State Interoperability; 108. support Machine-Readable Transition; 109. support Automated Transition Validation; 110. detect Forbidden Transitions; 111. preserve PRRM Re-Entry Boundary; 112. distinguish Reinstatement from Re-Entry; 113. determine State Continuity; 114. determine Transition Legitimacy; 115. preserve complete transition traceability; 116. produce a Governed Prediction Record State Transition.

122. Governance Logic

PRSTM applies the following operational logic:

Does a Governed Prediction Record exist?

If no:

→ State Transition governance cannot be established.

If yes:

→ identify Current Record State.

Has a lifecycle status change been requested or triggered?

If no:

→ preserve current state.

If yes:

→ identify Target State.

Is the transition permitted from the Current State?

If no:

→ classify:

Transition Not Supported

If yes:

→ continue.

Is sufficient Transition Authority present?

If no:

→ transition remains:

Pending

or:

Restricted

If yes:

→ preserve authority.

What triggered the transition?

→ preserve Trigger.

Why is the transition occurring?

→ preserve Reason.

When was the transition recorded and when did it become effective?

→ preserve both where materially different.

Does the transition modify predictive content?

If yes:

→ PVCN / PMRS governance may also apply.

Does the transition create a terminal or materially exited lifecycle state?

If yes:

→ preserve future PRRM Re-Entry Boundary.

Is the state disputed or conflicting across systems?

If yes:

→ preserve conflict.

Do not silently reconcile.

Is the transition retrospective or backdated?

If yes:

→ preserve qualification.

Then:

→ create State Transition Event;

→ preserve Prior State;

→ establish New State;

→ preserve State History;

→ preserve provenance;

→ determine Transition Legitimacy State;

→ determine State Continuity State.

Canonical transition:

Current Prediction Record State → Eligible Governed Transition → New Prediction Record State → Preserved State History

123. Minimum Implementation Framework

A. Prediction Record ID

Persistent reference to the governed Prediction Record.

B. Transition ID

Unique reference for the lifecycle-state transition.

C. Prior State

Prediction Record State immediately before transition.

D. Target / New State

Requested and resulting Prediction Record State.

E. Transition Trigger

Event, condition, governance rule, review, or system action initiating the transition.

F. Transition Reason

Governed explanation for why the lifecycle state changed.

G. Transition Authority

Human, system, organizational, automated, or hybrid authority responsible for the change.

H. Transition Timestamp

Time at which transition was recorded.

I. Effective Transition Time

Time at which new state became operationally effective.

J. Applicable Prediction Version

Prediction Version associated with the transition.

K. Transition Qualification

Temporary, conditional, emergency, disputed, retrospective, pending, or other material qualification.

L. Transition Legitimacy State

Supported, supported with qualification, pending, restricted, not supported, or unable to determine.

M. State Continuity State

Continuity status across historical Prediction Record states.

N. Provenance & Evidence Reference

Actor, approver, system, rule, source, and applicable evidence reference.

O. State Transition History

Ordered historical record of lifecycle-state changes and subsequent corrections, rollbacks, or reconciliations.

124. Governance Outputs

PRSTM may produce:

Governed Prediction Record State Transition Transition ID Prior Prediction Record State New Prediction Record State Transition Trigger Transition Reason Transition Authority Transition Timestamp Effective Transition Time Transition Qualification Transition Legitimacy State Prediction Version Reference Superseding Reference Withdrawal Record Suspension Record Retirement Record Archive Record Dispute Record Invalidation Qualification Reinstatement Record Rollback Record State Conflict Record State Mapping Record State Continuity State Transition Provenance Record State Transition History Lifecycle Status Traceability Record

The primary output is:

Governed Prediction Record State Transition

This becomes governed input to:

PRRM — Prediction Record Re-Entry Module

where a Prediction Record later returns after meaningful lifecycle exit.

125. Critical Distinctions

Record State Transition $\neq$ Prediction Revision

Prediction Version $\neq$ Prediction Record State

Trigger $\neq$ Reason

Transition Timestamp ≠ Effective Transition Time

Active ≠ Validated

Active ≠ Reliance-Eligible

Under Review ≠ Withdrawn

Restricted ≠ Inactive

Suspension ≠ Withdrawal

Superseded ≠ Deleted

Withdrawal ≠ Deletion

Withdrawal ≠ Prediction Failure

Withdrawal ≠ Retirement

Archive ≠ Delete

Disputed ≠ Invalid

Invalidated ≠ Nonexistent

Terminal ≠ Irreversible by Definition

Reinstatement ≠ Re-Entry by Default

Rollback ≠ History Erasure

Emergency ≠ Governance-Free

State Conflict ≠ Silent Reconciliation

Canonical State ≠ Complete State History

Pending ≠ Effective

State History ≠ Version History

Withdrawn ≠ Performance-Ineligible

Superseded ≠ Performance-Ineligible

Lifecycle Status ≠ Analytical Status

Lifecycle State ≠ Predictive Quality

Same Label ≠ Same State Meaning

Retrospective Transition ≠ Contemporaneous Transition

126. Enterprise Application

PRSTM can govern Prediction Record State Transition across:

AI forecasting systems; enterprise forecasting; financial forecasting; investment analysis; prediction markets; insurance; industrial prediction; predictive maintenance; supply chains; energy systems; infrastructure forecasting; technology forecasting; public-sector forecasting; expert forecasting; Human-AI systems; autonomous agents; model ensembles; multi-agent systems.

Its function remains constant:

allow Prediction Records to change lifecycle status without allowing the new status to erase, distort, or detach the state that came before it.

127. Use Case 1 — A Forecast Is Withdrawn and the Platform Removes It From History

A forecasting platform publishes:

"Company X will complete Acquisition Y by 30 June 2028 — 72% probability."

Two months later, major regulatory conditions change.

The prediction is formally withdrawn.

The platform changes:

Status: Active

to:

Status: Withdrawn

but then removes the prediction from the public historical interface and excludes it from historical statistics.

The critical governance question is:

Does withdrawal permit a Prediction Record to disappear from historical governance?

PRSTM answers:

No.

The state history should remain:

Formed → Active → Withdrawn

with:

Withdrawal Time; Withdrawal Trigger; Withdrawal Reason; applicable Prediction Version; Transition Authority.

The record may no longer be operationally active.

But its historical existence remains.

POFPS may later assess the prediction if a sufficiently governed outcome becomes available.

Withdrawal ≠ Deletion

Withdrawal ≠ Prediction Failure

Withdrawn ≠ Performance-Ineligible

128. Use Case 2 — An AI Forecast Is Suspended, Restored, and Later Archived

An industrial AI system predicts elevated failure risk for a turbine.

Initial state:

Active

A data-integrity alert is triggered.

The system automatically changes:

Active → Suspended

Human review confirms that one sensor stream was corrupted, but the remaining predictive basis remains usable after correction.

The prediction is then:

Suspended → Active

After the Prediction Horizon expires and the outcome is assessed:

Active → Retired → Archived

Without governed state history, the database may show only:

Archived

and lose the operational sequence.

PRSTM preserves:

Active

→ Suspended

→ Active

→ Retired

→ Archived

with each:

timestamp; authority; trigger; reason; applicable Prediction Version; transition qualification.

The critical governance question becomes:

Can a later observer determine not only the final record state, but which lifecycle status actually applied when the prediction was being used?

PRSTM ensures the answer can remain:

Yes.

Current Lifecycle State ≠ Complete Lifecycle State History

Archive ≠ Delete

129. Canonical Boundary

PRSTM governs the identification, eligibility, authorization, triggering, execution, qualification, temporal anchoring, provenance, integrity, interoperability, and historical preservation of Prediction Record lifecycle-state transitions, including Active, Under Review, Restricted, Suspended, Superseded, Withdrawn, Retired, Archived, Disputed, Invalidated where legitimately established, Reinstated, and other governed states. It preserves the relationship between Prior State and New State without allowing status change to erase Prediction Record history. It does not determine whether predictive content should be revised, create Prediction Versions, preserve the entire prediction lifecycle independently of PHPM, establish Predictive Performance, establish Operational Reality, or govern substantive lifecycle re-entry after historical exit.

PRFM owns:

Prediction Record Formation

PVCM owns:

Prediction Version Continuity

PHPM owns:

Prediction History Preservation

PRSTM owns:

Prediction Record State Transition

PRRM subsequently owns:

Prediction Record Re-Entry

130. Canonical Closing Statement

A Prediction Record is not defined only by what it predicts. It is also defined by whether it is active, under review, suspended, superseded, withdrawn, retired, archived, disputed, or legitimately returned to use.

PRSTM makes those lifecycle changes explicit so that status cannot be silently rewritten, withdrawal cannot become disappearance, archival cannot become deletion, and reinstatement cannot pretend that interruption never occurred.

The state may change. The transition must remain part of the record.
